Crop Reporting Districts

THE 1951 CROP SEASON

Crop yields in Indiana for 1951 were 107 percent of the 1940-49 average. No major field crop made a new record yield. Only wheat, rye and peaches were notably lower than average. The monthly condition of pasture averaged 87 percent of normal, or 5 points above the 10 year average.

The fall of 1950 was wet and cold generally, but at wheat seeding time soil conditions permitted field work and from the middle of October to early November temperatures were above normal, making the germination and early growth of small grain rapid. Growth was resumed in the southern part of the state in mid-January followed by record-breaking low temperatures the last week of January and the first week of February. This resulted in the killing of considerable winter wheat. Besides the acreage lost, stands on remaining acreage were thinned. Heavy rains the week of July 9-15 delayed wheat harvest in the north with some loss from shattering and weed growth. Rye was also adversely affected.

Although the spring of 1951 was not excessively wet, temperatures were below normal till the last week of April, making oats seeding and germination slow. After the middle of May, there was a 3 weeks period favorable for field work and plant growth. Corn and soybean seeding was completed in good time.

After mid-June, showers were frequent, thus delaying field work and hay harvest though not making an excessive amount of precipitation. From the last week in July there was a near approach to drought conditions in many areas throughout the state. This droughty condition began in southeastern Indiana much earlier and reduced crop yields in this area sharply. This incidence of drought in scattered local areas reduced prospective corn yields by 2.0 bushels. Probably the yield of soybeans was lower than would have been the case with better distributed rainfall.

October continued dry with about normal temperatures. This was favorable for completion of soybean harvest and the beginning of corn harvest. Some wheat germinated slowly because of dry soil.

November and December were very cold and wet. Completion of corn harvest was delayed and growth of fall sown grains stopped.

The yield of oats was 37.0 bushels per acre. This was lower than expected because of harvest loss by wet weather delay, and rapid weed growth.

The yield of corn was 53.0 bushels per acre, lowered because of spotty, droughty conditions in late summer.

The yield of winter wheat at 16.5 bushels was below average. Stands were thinned by winter killing in the south half of the state, and there was some harvest loss from shattering by wet weather delay of harvest, and some loss of heads because rapid weed growth prevented close cutting.

The yield of soybeans of 23.5 bushels has been exceeded only once.

Hay yields were mostly above average but rains at harvest time resulted in hay of lower quality than usual.

Fruit production was about 85 percent of average with a good crop of apples. Peaches were very poor because of winter damage.

Truck crop yields were mostly above average. Tomatoes made 8.4 tons per acre for a new record yield which was 161 percent of average.

The fall of 1951 had rather heavy precipitation but this came later in the season than the heavy rains that are frequently associated with low wheat yields in the next season. The seedings of winter wheat amounted to 1,556,000 acres or 96 percent of the 1950 crop seedings. December 1 condition of the 1951 crop was 86, three points below last year and slightly below average.

* Computed as follows: The index of Indiana farm prices reported in Table 4 was divided by the Bureau of Agricultural Economics' index of prices paid by U. S. farmers. From 1923 through 1936 the prices paid index included interest and taxes. From 1937 through 1951 the prices paid index included interest, taxes and wage rates. Index computed by Agricultural Economics Department, Purdue University.

TABLE 11. INDEX OF GRAIN PRICES RECEIVED BY INDIANA PRODUCERS, 1910-1951

1910-14 = 100

(Not adjusted for seasonal variation)

LIVESTOCK SUMMARY JANUARY 1, 1951

In 1950 livestock numbers on farms increased for meat animals. All cattle increased 5 percent, stock sheep 5 percent, and hogs 7 percent. Turkeys increased 4 percent. Chickens excluding broilers decreased 2 percent. Work animals continued the sharp decrease of the last several years. Horses decreased 12 percent and mules 18 percent.

Values per head were down 12 percent for horses and 15 percent for mules. Increased values per head were registerd for all other classes of livestock. Sheep gained 41 percent, all cattle 26 percent and milk cows 25 percent. The gain for hogs was 14 percent. Turkeys were valued 11 percent higher per head and chickens 9 percent. The total inventorial value rose from $390,-814,000 to $496,250,000, a gain of 25 percent.

There was some decrease in dairy cows and dairy heifers. Increases were made in all classes of beef animals. Prices of beef were high compared with dairy products. This resulted in continued close culling of dairy herds, and greater interest in beef type cattle.

Stock sheep increased for the second year. Gains were found in ewes over a year old with much greater increase in ewe lambs retained for breeding than in any other class of sheep. Lambs on feed at 84,000 were the same as last year.

The 1950 lamb crop was 105 percent of the breeding ewes of January 1, or 298,000 head. The wool crop was 359,000 fleeces averaging 7.7 pounds. The clip of 2,764,000 pounds sold for an average of 51 cents per pound.

The 1950 spring pig crop was 3,982,000 head. The fall crop of pigs was 4,252,000 head. Only in 1943 was the yearly total larger than the 8,234,000 head in 1950. Out of the 4,934,000 hogs on hand January 1, the 691,000 sows and the 592,000 other hogs over 6 months old numbered 2 percent more than for last year. The fall pigs, those under 6 months of age, totaled 7 percent more than last year.

Farm chickens showed a 3 percent loss in layers and 6 percent increase in other chickens. The rate of lay was high throughout the year and egg production of 2,252 million eggs was 3 percent below last year. Farm chickens raised totaled 29,968,000, a decrease of 7 percent from last year. Commercial broiler production in In-

diana reached a new high of 27,902,000 birds or 38 percent more than last year.

United States

Livestock and poultry on farms and ranches recorded a net increase during 1950 for the second successive year. The increase on January 1, 1951, amounts to 4 percent over January 1, 1950, but the number is still about 13 percent below the peak of January 1, 1944. The upturn was marked by substantial increases in cattle and hog numbers. It also featured a 4 percent increase in stock sheep, the first gain since the decline started in 1942. The number of milk cows was about the same as on January 1, 1950. The number of chickens was 3 percent below last year, while the number of horses and mules continued the decline that has been in progress for many years.

The 1950 pig crop was 5 percent larger than in 1949, and on January 1, 1951, more sows and gilts were held back to farrow the 1951 spring pig crop. On January 1, 1951 a record number of cattle and calves were on feed—5 percent more than on the same date in 1950. All sheep and lambs were higher at the end of the year with the increase in stock sheep more than offsetting a decline in the number of sheep and lambs on feed. Although the number of cows kept for milk has remained near the recent low point of January 1, 1949 milk production has been at a near record level. Commercial hatchery production during the first half of 1950 was 7 percent below the same period of 1949 and a 10 percent smaller crop of farm chickens was raised. However the increased demand for commercial broiler chicks during the last half of the year brought chick production for the year up to that of 1949. Commercial broiler production reached a record high level in 1950. On February 1, 1951 farmers expressed their intentions to buy 4 percent fewer baby chicks this year. The number of turkeys raised was a record high and prospects are for a slightly larger crop in 1951. The goat population showed an increase—the first since 1945.

The early outlook for 1950 feed production was less favorable than in 1949 but the crop year ended with the production of the third largest tonnage of feed grains on record. Hay production in 1950 closely approached the record high. Stocks of feed grains on farms January 1, 1951, while larger than in all but 3 previous years, were considerably smaller than on January 1 of the past 2

years. The supply of feed grains on farms per animal unit was below that of the last 2 years, but was above most other years since 1935.

The number of cattle and calves increased about four million head, or 5 percent from January 1, 1950, to January 1, 1951. This gain placed the number of cattle near the all-time peak war years of 1944 and 1945. All classes of cattle registered gains although milk cows remained practically unchanged from a year ago. The rise in cattle inventories was mostly in numbers kept for beef rather than for milk. Cows kept mainly for beef production reached a new high at the beginning of this year. About 5 percent more cattle and calves were on feed on January 1 this year than last, with a large proportion being calves. A large calf crop in 1950, together with a decrease in the slaughter of both cattle and calves, resulted in the increase of 5 percent in total cattle. Imports from Canada were larger than in the previous year, with the increase occurring in feeder type cattle. The quarantine on Mexican imports of cattle remained in force during 1950.

Sheep numbers showed an increase in 1950, after 8 years of declining inventories. Stock sheep numbers increased 4 percent from the all-time low on January 1, 1950. Sheep and lambs on feed on January 1, 1951, were down 6 percent from a year earlier, and the smallest since 1920. Slaughter of sheep and lambs in 1950 was 4 percent less than in 1949 and the smallest in 33 years. The proportion of ewes in the 1950 slaughter was slightly less than in 1949, and the lowest since 1941. With smaller ewe and lamb losses and reduced slaughter, the 1950 lamb crop was large enough to provide an increased inventory. The large holding of ewe lambs will provide sufficient replacements to continue an upward trend in sheep inventories.

Hogs on farms continued to increase and were up 7 percent from last year. The net increase totaled about 4½ million hogs in the United States. All of the net increase was in the 12 North Central States. Hogs under 6 months of age were up 11 percent and reflect the larger fall pig crop. Hogs over 6 months of age were up 4 percent. Marketing of hogs from the 1950 spring crop started early, as it did in the 1949 season. Earlier farrowings and heavier feeding rates again resulted in early marketings. During the last quarter of 1950, marketing weights were averaging slightly heavier than in the previous year.

Horse and mule numbers declined at about the same rapid rate as in recent years. This decline continued the downward trend

which began in 1915 for horses and in 1925 for mules. The small crop of horse and mule colts, which is much below that required to maintain present levels, points to the continued downward trend in workstock inventories.

Chickens on farms January 1, excluding commercial broilers, were down 3 percent from last year and were 5 percent below the average. Pullets were down 8 percent following a decrease of 10 percent in chickens raised in 1950, while hen numbers increased 7 percent. Turkey holdings on farms January 1 were about the same as a year ago, while breeder hen numbers were up 3 percent.
