Crop Production

Released October 11, 2012, by the National Agricultural Statistics Service (NASS), Agricultural Statistics Board, United States Department of Agriculture (USDA).

## Corn Production Down Slightly from September Forecast Soybean Production Up 9 Percent Cotton Production Up 1 Percent Orange Production Up 4 Percent from Last Season

Corn production is forecast at 10.7 billion bushels, down slightly from the September forecast and down 13 percent from 2011. This represents the lowest production in the United States since 2006. Based on conditions as of October 1, yields are expected to average 122.0 bushels per acre, down 0.8 bushel from the September forecast and 25.2 bushels below the 2011 average. If realized, this will be the lowest average yield since 1995. Area harvested for grain is forecast at 87.7 million acres, up less than 1 percent from the September forecast and up 4 percent from 2011. Acreage updates were made in several States based on administrative data.

Soybean production is forecast at 2.86 billion bushels, up 9 percent from September but down 8 percent from last year. Based on October 1 conditions, yields are expected to average 37.8 bushels per acre, up 2.5 bushels from last month but down 4.1 bushels from last year. Compared with last month, yield forecasts are higher or unchanged across all States. Area for harvest in the United States is forecast at 75.7 million acres, up 1 percent from September and up 3 percent from last year. Acreage updates were made in several States based on administrative data.

All cotton production is forecast at 17.3 million 480-pound bales, up 1 percent from last month and up 11 percent from last year. Yield is expected to average 795 pounds per acre, up 5 pounds from last year. Upland cotton production is forecast at 16.6 million 480 -pound bales, up 13 percent from 2011. Pima cotton production, forecast at 657,000 bales, was carried forward from last month.

The United States all orange forecast for the 2012-2013 season is 9.37 million tons, up 4 percent from the 2011-2012 final utilization. The Florida all orange forecast, at 154 million boxes ( 6.93 million tons), is up 5 percent from last season's final utilization. Early, midseason, and Navel varieties in Florida are forecast at 74.0 million boxes ( 3.33 million tons), slightly lower than last season. The Florida Valencia orange forecast, at 80.0 million boxes ( 3.60 million tons), is up 10 percent from the 2011-2012 crop. Weather conditions in Florida during early 2012 were characterized by extreme drought conditions across the citrus producing region. Tropical Storms Debby in June and Isaac in August produced torrential rainfall, which ended Florida's drought situation. Average fruit per tree is projected to be 14 percent higher than last season. California's Navel orange crop was developing on a more normal schedule than the previous two years, with harvest expected to begin by early-November.

Florida frozen concentrated orange juice (FCOJ) yield forecast for the 2012-2013 season is 1.61 gallons per box at 42.0 degrees Brix, down 1 percent from last season's final yield of 1.63 gallons per box. Projected yield from the 2012-2013 early-midseason and Valencia varieties will be published in the January Crop Production report. All projections of yield assume the processing relationships this season will be similar to those of the past several seasons.

This report was approved on October 11, 2012.

Acting Secretary of
Agriculture
Joseph W. Glauber

Agricultural Statistics Board
Chairperson
Hubert Hamer

## Corn for Grain Objective Yield Data

The National Agricultural Statistics Service is conducting objective yield surveys in 10 corn-producing States during 2012. Randomly selected plots in corn for grain fields are visited monthly from August through harvest to obtain specific counts and measurements. Data in these tables are rounded actual field counts from this survey.

## Soybean Objective Yield Data

The National Agricultural Statistics Service is conducting objective yield surveys in 11 soybean-producing States during 2012. Randomly selected plots in soybean fields are visited monthly from August through harvest to obtain specific counts and measurements. Data in this table are actual field counts from this survey.

## September Weather Summary

The Nation's historic drought of 2012 continued its shift toward the northwest during September. Extremely dry conditions fostered a record-setting pace of corn and soybean harvesting in the upper Midwest, but delayed winter wheat planting and emergence across the northwestern half of the Plains and parts of the Northwest. According to the United States Drought Monitor, late-September drought coverage in the contiguous United States reached 65.45 percent, surpassing by 1.59 percent the previous high established on July 24, 2012.

In contrast, September rainfall continued to benefit some late-developing soybeans in the Mid-South and lower Midwest. In those regions, early-September rainfall was associated with the remnants of Hurricane Isaac. As the month progressed, additional rainfall in both regions aided pastures and boosted soil moisture in preparation for soft red winter wheat planting. Occasional rainfall also maintained generally favorable conditions for pastures and maturing summer crops in the Gulf and Atlantic Coast States.

The eastern half of the United States also got a reprieve from the high temperatures that plagued most areas during the 2012 growing season. The coolest weather, relative to normal, covered the Midwest, while most other areas from the eastern Plains to the East Coast noted near-normal temperatures. In Illinois, Chicago reported its first cooler-than-normal month since September 2011.

Farther south, wetter conditions developed across the southern half of the Plains. Some of the most impressive rain fell late in the month, when the interaction between a cold front and remnant moisture associated with former eastern Pacific Hurricane Miriam and Tropical Storm Norman contributed to heavy rain in the south-central United States. The rain helped to revive rangeland and pastures, and promoted the emergence of newly planted hard red winter wheat.

Elsewhere, much of the West experienced a warm, dry month. In fact, record-setting September warmth covered parts of the Far West, while portions of the Northwest received no measurable rainfall. As a result, wildfires remained a periodic problem in the Northwest. Meanwhile, lingering monsoon showers in the Southwest withdrew by mid-September, roughly on schedule, following a fairly robust summer wet season.

## September Agricultural Summary

September brought near to above average temperatures to much of the United States, promoting crop development and aiding a rapid fieldwork pace. Most notably, temperatures in portions of the West reached as many as 6 degrees above average. Precipitation in most regions from the Great Lakes westward totaled less than 25 percent of normal, leading to further declines in crop conditions and soil moisture levels, while at the same time delaying the start of overwintered small grain seeding. Elsewhere, late-summer and early-fall storms brought beneficial moisture to portions of southern Great Plains and most areas east of the Mississippi River.

As September began, hot, dry weather in the Great Plains and western Corn Belt helped to maintain rapid phenological development of this year's corn crop. With denting nearing completion in many locations, 41 percent of the Nation's corn crop was at or beyond the mature stage by September 2, twenty-six percentage points ahead of last year and 25 percentage points ahead of the 5 -year average. Early-month rainfall in portions of the eastern Corn Belt limited fieldwork, while helping to recharge soil moisture levels. Iowa producers focused on harvesting fields with weaker stalks or wind damage during the week ending September 9 . Nationally, favorable weather conditions had pushed crop maturity to 76 percent complete by September 16, the quickest maturity pace since 1987 when 80 percent of the corn crop was at or beyond the mature stage. In Iowa, consistently dry weather provided ample time for fieldwork, and by September 23, harvest was reported as being over three weeks ahead of normal. Aided by mild, mostly dry weather in the Midwest, corn producers were harvesting the Nation's crop at one of the quickest paces on record. By month's end, 54 percent of the crop had been combined, 36 percentage points ahead of last year and 34 percentage points ahead of the 5 -year average. Overall, 25 percent of the corn crop was reported in good to excellent condition on September 30, compared with 22 percent on September 2 and 52 percent from the same time last year.

Nationally, heading of the sorghum crop was steady but behind normal as September began, with progress complete or nearing completion in many States. The most significant delay evident by September 2 existed in Nebraska, where low
soil moisture levels throughout the growing season had negatively impacted crop growth. With coloring past the halfway mark and crop maturity evident in most States, harvest was advancing slowly as activity was limited to portions of the Great Plains and the Delta. Warmer than normal temperatures promoted double-digit coloring in the Great Plains during the week ending September 9, with harvest underway ahead of the normal pace in Kansas. Near-normal temperatures favored rapid crop maturity mid-month. By September 16, forty-two percent of the Nation's sorghum crop was at or beyond the mature stage, 6 percentage points ahead of the 5 -year average. Harvest progress remained slow but steady during the second half of the month. In Texas, harvest was ongoing in the Plains but complete in most other areas by month's end. Nationwide, 34 percent of the sorghum crop was harvested by September 30, six percentage points ahead of last year and 2 percentage points ahead of the 5 -year average. Overall, 24 percent of the sorghum crop was reported in good to excellent condition on September 30, unchanged from ratings on September 2 and from the same time last year.

While barley harvest was complete in Minnesota and North Dakota, dry, mostly sunny weather promoted a rapid fieldwork pace in Washington during the week ending September 2. Nationally, harvest had advanced to 95 percent complete by September 9, sixteen percentage points ahead of last year and 13 percentage points ahead of the 5 -year average.

While many producers waited for improved soil moisture levels before beginning fieldwork, seeding of the 2013 winter wheat crop was underway in several States by September 9. Mid-month storms systems delivered much-needed rainfall to portions of the Great Plains, boosting soil moisture levels and prompting sowing in some areas. By September 23, one-quarter of the winter wheat crop was in the ground, 3 percentage points ahead of last year but 2 percentage points behind the 5 -year average. In Texas, some producers were busy seeding their crop toward month's end, while others were plowing and applying pre-plant fertilizers. Unfavorably dry soils in portions of the Great Plains and Pacific Northwest led to delays in seeding and crop emergence. By month's end, 40 percent of the winter wheat crop was sown and 12 percent had emerged, both behind the 5 -year average.

Following a mild winter that allowed for earlier than normal spring wheat seeding, favorable weather conditions prompted rapid phenological development throughout the summer and provided ample time for producers to complete fieldwork. By September 2, spring wheat producers had harvested 95 percent of this year's crop, 32 percentage points ahead of last year and 23 percentage points ahead of the 5 -year average. In North Dakota, harvest was complete by September 2, compared with last year when only 59 percent of the spring wheat crop had been combined.

Despite damaging wind and heavy rainfall associated with Hurricane Isaac in portions of the Delta, rice producers were harvesting this year's crop at one of the quickest paces on record as September began. By September 9, over half of the Nation's crop had been harvested, approximately two weeks ahead of normal. Mid-month harvest delays in portions of Arkansas resulted from early-month thunderstorms that caused lodging in some rice fields. By September 16, harvest had begun in California, but progress in the State was behind normal. With harvest virtually complete in Louisiana by September 23, many producers focused on building levees for their 2013 crop toward month's end. As harvest in California fell further behind despite fieldwork being in full swing, overall progress slowed as September ended. Nationally, three-quarters of this year's rice crop was harvested by September 30, fourteen percentage points ahead of last year and 11 percentage points ahead of the 5 -year average. Overall, 66 percent of the rice crop was reported in good to excellent condition as harvest surpassed the halfway mark during the week ending September 9, compared with 64 percent from the same time last year.

While the beginning of September found soybean producers in areas of the Corn Belt hoping that late-season rainfall would benefit pod fill in late-planted fields, leaf drop advanced to 19 percent complete Nationally by September 2, fourteen percentage points ahead of last year and 10 percentage points ahead of the 5-year average. Warm temperatures aided rapid crop maturity as the month progressed. By mid-month, many producers in the Corn Belt had completed corn harvest and switched their focus to soybeans as mild temperatures and mostly dry weather provided ample time for fieldwork. By September 16, ten percent of the Nation's soybean crop was harvested, 6 percentage points ahead of both last year and the 5 -year average. Toward month's end, pods in some fields in Indiana were reported as mature; however, producers were forced to reduce harvest speeds due to stalks being too green. Favorable late-month weather conditions not only maintained rapid crop maturity, but provided ample time for a torrid fieldwork pace. By September 30, producers had harvested 41 percent of this year's soybean crop, 26 percentage points ahead of last year and 22 percentage points ahead of the 5-year average, and one of the quickest harvest paces on record. Overall, 35 percent of the soybean crop was
reported in good to excellent condition on September 30, compared with 30 percent on September 2 and 54 percent from the same time last year.

While sunflowers were being harvested in a limited number of fields by mid-September, mild, dry weather toward month's end boosted fieldwork in the major producing States. By September 30, producers had harvested 14 percent of this year's crop, 11 percentage points ahead of both last year and the 5-year average.

As the month began, early peanut harvest was underway in Florida and Georgia; however, in Georgia, wet fields limited progress in many areas, while the effects of poor nodulation became evident in some fields. By September 16, producers Nationwide had harvested 7 percent of this year's crop, 3 percentage points ahead of both last year and the 5 -year average. Producers in southern Alabama had dug 15 percent of their peanut crop by September 23, but combining progress was slow and behind the normal pace. As fields in Georgia dried out toward month's end, producers were rapidly digging peanuts ahead of additional forecasted rainfall. Nationally, 22 percent of the peanut crop was harvested by September 30, five percentage points ahead of last year and 4 percentage points ahead of the 5 -year average. Overall, 79 percent of the peanut crop was reported in good to excellent condition on September 30, compared with 76 percent on September 2 and 39 percent from the same time last year.

Opened bolls were evident in 36 percent of the Nation's cotton crop by September 2, slightly behind last year but 6 percentage points ahead of the 5 -year average. As boll set reached completion in many cotton fields in Texas' High Plains region, bolls were opening rapidly under warm, mostly sunny skies early in the month. High water and strong winds associated with Hurricane Isaac damaged cotton fields throughout Louisiana, while many fields in Mississippi suffered little to no damage despite rainfall in excess of 6 inches. With activity limited to Arizona, Texas, and the Delta, producers had harvested 4 percent of this year's crop by September 9 , slightly behind the 5 -year average. By mid-month, many cotton producers in the Plains regions of Texas had shut off their irrigation systems and were busy defoliating in preparation for harvest. Nationally, harvest progress inched forward as producers in portions of the Cotton Belt slowly began to pick their first fields during the week ending September 16. In Georgia, defoliation was active in many areas toward month's end, with harvest expected to gain speed in the coming weeks. Nationally, 78 percent of the cotton crop was at or beyond the boll opening stage by September 30, five percentage points ahead of the 5 -year average. Fourteen percent of this year's cotton crop was harvested by month's end, slightly behind the average pace. Overall, 42 percent of the cotton crop was reported in good to excellent condition on September 30, compared with 42 percent on September 2 and 29 percent from the same time last year.

By September 2, sugarbeet producers had harvested 6 percent of this year's crop, 5 percentage points ahead of the 5 -year average. With harvest well underway in Minnesota and North Dakota, more than three-quarters of the crop in both States was reported in good to excellent condition. Hail damage was reported in some fields in south-central Idaho early in the month. While sunny days coupled with cool nights aided overall crop quality, harvest in Michigan was continued on a limited basis throughout the month, as producers anticipated an October 22 start to open piling and long-term storage. Producers in south-central and eastern portions of Idaho began harvesting their crop mid-month, with progress advancing ahead of the normal pace. By September 30, producers Nationwide had harvested 19 percent of the sugarbeet crop, 8 percentage points ahead of last year and 4 percentage points ahead of the 5 -year average.

## Crop Comments

Corn: Acreage updates were made in several States based on administrative data. Total planted area, at 96.9 million acres, is up less than 1 percent from the previous estimate. Area harvested and to be harvested for grain is forecast at 87.7 million acres, up less than 1 percent from the September forecast.

As of September 30, only 25 percent of the corn acreage was rated in good to excellent condition in the 18 major producing States, compared with 22 percent rated in these two categories on September 2 and 52 percent from the same time last year. Fifty percent of the acreage was rated in very-poor to poor condition compared to only 20 percent rated in these two categories last year at this time.

The October 1 corn objective yield data indicate the lowest number of ears per acre since 2005 for the combined 10 objective yield States (Iowa, Illinois, Indiana, Kansas, Minnesota, Missouri, Nebraska, Ohio, South Dakota, and Wisconsin).

Rapid phenological development of this year's corn crop continued through September. As of September 30, ninety-four percent of the corn acreage was rated mature or beyond, 20 percentage points ahead of the same time last year and 22 percentage points ahead of the 5 -year average. Aided by mild, mostly dry weather in the Midwest, corn producers were harvesting the Nation's crop at one of the quickest paces on record. Fifty-four percent of the intended grain acreage was harvested by September 30, thirty-six percentage points ahead of last year and 34 percentage points ahead of the 5 -year average pace.

Sorghum: Production is forecast at 252 million bushels, up 2 percent from last month and up 18 percent from last year. Acreage updates were made in several States based on administrative data. Planted area, at 6.24 million acres, is up slightly from the previous estimate and up 14 percent from last year. Area harvested for grain is forecast at 5.02 million acres, down 2 percent from September 1 but up 28 percent from 2011. Based on October 1 conditions, yield is forecast at 50.2 bushels per acre, up 1.9 bushels from last month but down 4.4 bushels from last year. A record high yield is forecast in Louisiana, where farmers reported mostly favorable growing conditions.

As of September 30, the sorghum crop had progressed to 56 percent mature, 6 percentage points ahead of last year but 1 percentage point behind the 5 -year average. Harvest progress had reached 34 percent, 6 percentage points ahead of last year and 2 percentage points ahead of the 5 -year average. Twenty-four percent of the crop was rated in good to excellent condition, unchanged from last year.

Rice: Production is forecast at 199 million cwt, up 1 percent from September and up 7 percent from last year. Area for harvest is expected to total 2.68 million acres, unchanged from September but 2 percent higher than 2011. Based on conditions as of October 1, the average United States yield is forecast at a record high 7,428 pounds per acre, up 94 pounds from September and up 361 pounds from last year. Record high yields are also forecast in Arkansas, Louisiana, and Texas.

As of September 30, seventy-five percent of the United States acreage was harvested, 14 percentage points ahead of last year and 11 points ahead of the 5 -year average. Harvest progress was well ahead of last year in Arkansas, Mississippi, and Missouri, where 90 percent, 94 percent, and 84 percent of the crop had been harvested, respectively. By the end of September, harvest was nearly complete in Louisiana and Texas.

Soybeans: Acreage updates were made in several States based on administrative data. Planted area, at 77.2 million acres, is up 1 percent from the previous estimate. Area for harvest is forecast at 75.7 million acres, up 1 percent from September and up 3 percent from 2011. If realized, harvested area will be the third largest on record.

The October objective yield data for the combined 11 major soybean-producing States (Arkansas, Illinois, Indiana, Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota, Ohio, and South Dakota) indicate a lower pod count compared with last year, as hot, dry weather during bloom hampered development of the crop in many areas. Compared with final counts for 2011, pod counts are down in all States. The largest declines from 2011's final pod counts are expected in Illinois, Missouri, and Nebraska, all down more than 570 pods per 18 square feet.

As of September 30, eighty-five percent of the soybean crop was dropping leaves or beyond, 14 percentage points ahead of last year's pace and 8 percentage points ahead of the 5 -year average. Progress was equal to or ahead of normal in all major-producing States except Kansas, Kentucky, North Carolina, and Tennessee. The percent of acreage dropping leaves was more than 10 points ahead of normal in Arkansas, Illinois, Iowa, Michigan, Nebraska, and Wisconsin. Harvest progress, at 41 percent complete, was 26 percentage points ahead of last year's pace and 22 percentage points ahead of normal. Harvest progress was more than 50 percentage points ahead of normal in Minnesota, North Dakota, and South Dakota.

As of September 30, thirty-five percent of the United States soybean crop was rated in good to excellent condition, 19 percentage points below the same week in 2011. Crop conditions improved during September in 14 of the 18 major soybean States.

If realized, the forecasted yield in Arkansas, Louisiana, Mississippi, North Carolina, and Virginia will be a record high.
Sunflower: The first production forecast for 2012 is 2.46 billion pounds, up 21 percent from 2011. Area planted, at 1.92 million acres, is up 6 percent from the June estimate and is up 24 percent from last year. Sunflower growers expect to harvest 1.82 million acres, up 5 percent from June and up 25 percent from the 2011 acreage. Despite the large increase from last year, harvested area for the Nation is expected to be the fourth lowest since 1989. The October yield forecast, at 1,354 pounds per acre, is 44 pounds lower than last year's yield.

As of October 1, lower yields are expected in Colorado, Nebraska, and South Dakota compared with last year as the hot and dry conditions this summer lowered yield expectations. The forecasted production in North Dakota, the leading sunflower State in terms of planted area, is 1.25 billion pounds, up 63 percent from 2011 when wet spring conditions hampered planting. Development of the sunflower crop in North Dakota progressed ahead of normal and last year's pace throughout the year. As of September 30, fifty-five percent of the sunflower crop in North Dakota was rated as good to excellent, compared with 73 percent at the same time last year. As of September 30, harvest progress lagged behind normal in Colorado, but was ahead of last year's pace and the 5-year average in Kansas, North Dakota, and South Dakota.

Peanuts: Production is forecast at 6.11 billion pounds, up 3 percent from the September forecast and up 67 percent from last year's revised production of 3.66 billion pounds. Area for harvest is expected to total 1.59 million acres, unchanged from September and 48 percent higher than 2011. Based on conditions as of September 1, the average yield for the United States is forecast at a record high 3,832 pounds per acre, up 118 pounds from September and up 446 pounds from last year. Record high yields are also expected in Florida and Georgia, and yields will tie record highs in North Carolina and Oklahoma, if realized.

Harvest was underway in all States by the end of September. As of September 30, twenty-two percent of the United States acreage was harvested, 5 percentage points ahead of last year and 6 percentage points ahead of the 5 -year average. Crop condition improved slightly from last month, with 79 percent rated good to excellent as of September 30.

Canola: The first production forecast for 2012 is 2.48 billion pounds, up 62 percent from 2011 and will be the largest production on record, if realized. Area planted, at a record high 1.77 million acres, is up 9 percent from the June estimate and up 65 percent from last year. Canola farmers expect to harvest a record high 1.74 million acres, up 9 percent from June and up 67 percent from 2011. The October yield forecast, at 1,430 pounds per acre, is 45 pounds below last year's yield.

The yield in North Dakota, the largest canola-producing State, is forecast at 1,420 pounds per acre, down 80 pounds from last year's yield. Planted area in North Dakota is estimated at a record high 1.46 million acres, an increase of 70 percent from 2011. An unusually warm and dry spring this year prompted an early start to planting and rapid crop development. Maturation of the crop remained ahead of normal throughout the growing season and harvest began early. By September 9, ninety-eight percent of the crop in North Dakota was harvested, more than 30 percentage points ahead of last year and the 5-year average.

Cotton: Upland cotton harvested area is expected to total 10.2 million acres, unchanged from last month but up 11 percent from 2011. Pima harvested area, at 237,400 acres, was carried forward from last month.

As of September 30, forty-two percent of the cotton acreage was rated in good to excellent condition compared with 29 percent this time last year. Seventy-eight percent of the crop had bolls opening by September 30, three percentage point behind last year but 5 percentage points ahead of the 5 -year average. Fourteen percent of the crop had been harvested by September 30, one percentage point behind both last year and the 5 -year average.

Wet conditions delayed fieldwork in parts of the Delta and Southeast during much of September. However, by the end of the month, drier conditions allowed fieldwork to gain momentum. Record high yields are forecast in Arizona, Florida, and Georgia. In Texas, objective yield data forecasted boll weights to be higher than last year but below the 10 -year average.

Ginnings totaled $1,557,950$ running bales prior to October 1 , compared with $1,733,600$ running bales ginned prior to the same date last year.

Alfalfa and alfalfa mixtures: Production is forecast at 55.6 million tons, up 1 percent from August but down 15 percent from last year. If realized, this will be the lowest production level since 1953. Based on October 1 conditions, yield is expected to average 2.95 tons per acre, up 0.03 ton from August but down 0.45 ton from last year. If realized, this will be the lowest United States yield since 1988. Harvested area is forecast at 18.8 million acres, down 2 percent from 2011.

Monsoonal moisture in the Southwest led to expected increases in alfalfa hay yield throughout the region. Similarly, increased rainfall in the eastern Corn Belt allowed producers to harvest additional cuttings from what was anticipated in August. Conversely, above average temperatures and limited rainfall continued to plague much of the Northern Tier, western Corn Belt, and central Great Plains during September, causing further depletion of soil moisture levels. Forecasted alfalfa hay yields throughout most of these regions declined compared both to August and last year. Some of the largest expected yield declines were evident in the Great Plains and Corn Belt, where temperatures have remained warmer than normal and precipitation totals have been less than 50 percent of normal since July.

Other hay: Production of other hay is forecast at 66.4 million tons, up 1 percent from both the August forecast and last year. If realized, this will be the second lowest production level since 1990. Based on October 1 conditions, yields are expected to average 1.71 tons per acre, up 0.02 ton from August but down 0.1 ton from last year. If realized, this will be the lowest United States yield since 1988. Harvested area is forecast at 38.8 million acres, up 6 percent from last year.

Beneficial rainfall during September boosted growth in many grass hay fields and pastures throughout much of the eastern half of the United States which led to expected increases in forecasted other hay yields when compared with both August and 2011. Conversely, scarce August and September precipitation intensified prolonged drought conditions across much of the Northern Tier and in the Rocky Mountains prompting even larger declines in yield potential for other hay this season when compared with last year.

Dry beans: United States dry edible bean production is forecast at 31.0 million cwt for 2012, up 56 percent from last year. Planted area is forecast at 1.73 million acres, up 44 percent from 2011. Harvested area is forecast at 1.69 million acres, 46 percent above the previous year. The average United States yield is forecast at 1,836 pounds per acre, an increase of 120 pounds from 2011. If realized, yield will be at a record level exceeding the previous high of 1,768 pounds set in 2008.

In North Dakota, crop development began and remained ahead of last year and the 5-year average. As of September 30, ninety-five percent of the crop was harvested, about a month ahead of the five-year average. Throughout August and September, dry edible bean condition was rated mostly fair to good.

Tobacco: United States all tobacco production for 2012 is forecast at 780 million pounds, up 30 percent from 2011. Area harvested is forecast at 338,080 acres, 4 percent above last year. Average yield for 2012 is forecast at 2,308 pounds per acre, 467 pounds above 2011.

Flue-cured tobacco production is expected to total 495 million pounds, 44 percent above last year. North Carolina production levels rebounded from last year's hurricane damaged crop.

Burley production is expected to total 202 million pounds, up 17 percent from last year. Kentucky growers reported that rain during August and September aided the crop after a very dry July.

Sugarbeets: Production of sugarbeets for the 2012 crop year is forecast at 35.6 million tons, up 23 percent from last year. Producers expect to harvest 1.22 million acres, up slightly from the previous forecast. Expected yield is forecast at
29.3 tons per acre, unchanged from the previous month but 5.5 tons higher than last year. If realized, this will be a record yield for the United States.

Most of the growing region experienced dry growing conditions during September. However, early planting, hot temperatures, and adequate irrigation boosted the crop's potential.

Sugarcane: Production of sugarcane for sugar and seed in 2012 is forecast at 31.3 million tons, up 1 percent from the September 1 forecast and up 6 percent from 2011. Producers intend to harvest 898,000 acres for sugar and seed during the 2012 crop year, up 5,000 acres from the previous forecast. Expected yield for sugar and seed is forecast at 34.8 tons per acre, up 0.1 ton from the September 1 forecast.

The sugarcane crop in Florida and Louisiana benefitted from adequate rainfall during September. In Louisiana, harvest was slowed due to some lodging of the crop caused by Hurricane Isaac.

Grapefruit: The 2012-2013 United States grapefruit crop is forecast at 1.23 million tons, up 5 percent from last season's final utilization. In Florida, fruit per tree is forecast to be significantly higher than the previous season. Projected droppage in Florida is expected to be above average for both white and colored grapefruit, while average size of grapefruit is projected to be smaller than average for both types.

Lemons: The forecast for the 2012-2013 United States lemon crop is 888,000 tons, up 4 percent from the previous season's final utilization. Arizona's lemon crop is forecast to be up 127 percent from last season after groves rebound from a major freeze last year. Lemon harvest continued in southern California.

Tangelos: Florida's tangelo forecast is 1.20 million boxes ( 54,000 tons), up 4 percent from last season's final utilization. The forecasted fruit per tree is up from last year. Fruit size is projected to be below average with above average droppage.

Tangerines and mandarins: The United States tangerine and mandarin crop is forecast at 689,000 tons, up 6 percent from the 2011-2012 crop. In California, younger trees are transitioning to bearing age, which accounts for much of the increase in mandarin production in the State. In Florida, fruit per tree is forecast to be higher than last season in the Fallglo and Sunburst varieties, but lower in the Honey variety. Fruit size is projected to be smaller than average in the Fallglo variety, but average in the Sunburst and Honey varieties. Droppage is projected to be below average for the Fallglo variety and above average for the Sunburst and Honey varieties.

Florida citrus: In the citrus growing areas, weather stations reported high temperatures for the month ranging from the upper 80s to the low 90 s. Rainfall was moderate across the citrus producing region for most of the month, ranging from three to four inches in some areas to none at all in others. The citrus growing region remained drought free this month. Harvest of Fallglo tangerines began. Application of fall miticide and herbicide, young tree care, harvest preparations for Navels and grapefruit, and general grove maintenance were the primary grove activities.

California citrus: Planting continued in new citrus groves. Valencia oranges were picked, packed, and also sorted for color due to re-greening with some oversized fruit being juiced. Tangerines continued to size and color. Lemons were picked and packed.

California noncitrus fruits and nuts: The hot and dry weather provided excellent harvest conditions for most of the fruit crops. Orchards and vineyards continued to be irrigated. Peach, nectarine, and fresh plum harvests were winding down. Cling peach harvest was complete. Pruning, topping, and general orchard cleanup were the primary activities in stone fruit orchards that had completed harvest. Prune harvest was complete in the San Joaquin Valley with excellent yields reported. Prune harvest was nearly complete in the Sacramento Valley. Harvest of late variety table grapes, Autumn Royal, Crimson Seedless, Red Flame, Red Globe, and Thompson Seedless continued. Raisin grapes were being dried, with some being dried on the vine. Raisins that had finished drying were collected and processed. Weather conditions were good for drying. White wine grape harvest was in full swing across the State with red wine grape harvest picking up. Persimmons continued to size and color. Pomegranate harvest was underway in the San Joaquin Valley, while harvest in the Sacramento Valley was expected to begin soon. Gala, Fuji, and Granny Smith apple as well as Bartlett, Bosc, and Asian pear harvests continued. Fig harvest was ongoing. Kiwi harvest was expected to begin soon. Olive fruit continued to
mature with harvest getting underway in Tulare County. Almond harvest continued. Walnut harvest was underway. Pistachio harvest was in full swing. Pecans were developing well.

Pecans: Production is forecast at 309 million pounds (utilized, in-shell basis), up 14 percent from 2011. Improved varieties are expected to produce 253 million pounds or 82 percent of the total. The native and seedling varieties are expected to produce 55.9 million pounds, making up the remaining 18 percent of production.

In Georgia, despite the "off" year in the alternate bearing cycle for pecans, the crop is expected to be good due to favorable weather conditions. In New Mexico, increased production is expected due to mild conditions and reports of more orchards coming into production. In Texas, producers reported an increase for the 2012 crop as growing conditions improved from the previous year.

## Statistical Methodology

Field crop survey procedures: Objective yield and farm operator surveys were conducted between September 24 and October 5 to gather information on expected yield as of October 1. The objective yield surveys for corn, cotton, and soybeans were conducted in the major producing States that usually account for about 75 percent of the United States production. Randomly selected plots were revisited to make current counts. The counts made within each sample plot depend on the crop and the maturity of that crop. In all cases, plant counts are recorded along with other measurements that provide information to forecast the number of ears, bolls, or pods and their weight. The counts are used with similar data from previous years to develop a projected biological yield. The average harvesting loss is subtracted to obtain a net yield. The plots are revisited each month until crop maturity when the fruit is harvested and weighed. After the farm operator has harvested the sample field, another plot is sampled to obtain current year harvesting loss.

The farm operator survey was conducted primarily by telephone with some use of mail, internet, and personal interviewers. Approximately 14,400 producers were interviewed during the survey period and asked questions about probable yield. These growers will continue to be surveyed throughout the growing season to provide indications of average yields.

Orange survey procedures: The orange objective yield survey for the October 1 forecast was conducted in Florida, which produced about 73 percent of the United States production last season. In August and September 2012, the number of bearing trees and the number of fruit per tree were determined. In August and subsequent months, fruit size measurement and fruit droppage surveys are conducted to develop the current forecast of production. California and Texas conduct grower and packer surveys on a quarterly basis in October, January, April, and July. California conducts an objective measurement survey in September for navel oranges and in March for Valencia oranges.

Field crop estimating procedures: National and State level objective yield and grower reported data were reviewed for reasonableness and consistency with historical estimates. The survey data were also reviewed considering weather patterns and crop progress compared to previous months and previous years. Each State Field Office submits their analysis of the current situation to the Agricultural Statistics Board (ASB). The ASB uses the survey data and the State analyses to prepare the published October 1 forecasts.

Orange estimating procedures: State level objective yield estimates for Florida oranges were reviewed for errors, reasonableness, and consistency with historical estimates. Reports from growers and packers in California and Texas were also used for setting estimates. These three States submit their analyses of the current situation to the Agricultural Statistics Board (ASB). The ASB uses the survey data and the State analyses to prepare the published October 1 forecast.

Revision policy: The October 1 production forecast will not be revised; instead, a new forecast will be made each month throughout the growing season. End-of-season estimates are made after harvest. At the end of the marketing season, a balance sheet is calculated using carryover stocks, production, exports, millings, feeding, and ending stocks. Revisions are then made if the balance sheet relationships or other administrative data warrant changes. Estimates of planted acres for spring planted crops are subject to revision in the August Crop Production report if conditions altered the planting intentions since the mid-year survey. Planted acres may also be revised for cotton, peanuts, and rice in the September Crop Production report each year; spring wheat, Durum wheat, barley, and oats only in the Small Grains Annual report at the end of September; and all other spring planted crops in the October Crop Production report. Revisions to planted acres will only be made when special survey data, administrative data, such as Farm Service Agency program "sign up" data, or remote sensing data are available. Harvested acres may be revised any time a production forecast is made if there is strong evidence that the intended harvested area has changed since the last forecast. End-of-season orange estimates will be published in September's Citrus Fruits Summary. The orange production estimates are based on all data available at the end of the marketing season, including information from marketing orders, shipments, and processor records. Allowances are made for recorded local utilization and home use.

Reliability: To assist users in evaluating the reliability of the October 1 production forecast, the "Root Mean Square Error," a statistical measure based on past performance, is computed. The deviation between the October 1 production forecast and the final estimate is expressed as a percentage of the final estimate. The average of the squared percentage deviations for the latest 20-year period is computed. The square root of the average becomes statistically the "Root Mean

Square Error." Probability statements can be made concerning expected differences in the current forecast relative to the final end-of-season estimate, assuming that factors affecting this year's forecast are not different from those influencing recent years. For example, the "Root Mean Square Error" for the October 1 corn for grain production forecast is 3.2 percent. This means that chances are 2 out of 3 that the current production forecast will not be above or below the final estimate by more than 3.2 percent. Chances are 9 out of 10 ( 90 percent confidence level) that the difference will not exceed 5.5 percent.

Also, shown in the following table is a 20 -year record for selected crops of the differences between the October 1 forecast and the final estimate. Using corn again as an example, changes between the October 1 forecast and the final estimate during the last 20 years have averaged 206 million bushels, ranging from 3 million bushels to 624 million bushels. The October 1 forecast has been below the final estimate 9 times and above 11 times. This does not imply that the October 1 corn forecast this year is likely to understate or overstate final production.

Reliability of October 1 Crop Production Forecasts
[Based on data for the past twenty years]

| Crop | Root mean square error | 90 percent confidence interval | Difference between forecast and final estimate |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Production |  |  | Years |  |
|  |  |  | Average | Smallest | Largest | Below final | Above final |
|  | (percent) | (percent) | (millions) | (millions) | (millions) | (number) | (number) |
| Corn for grain ................................. bushels | 3.2 | 5.5 | 206 | 3 | 624 | 9 | 11 |
| Dry edible beans ....................................cwt | 3.4 | 5.9 | 1 | (Z) | 3 | 15 | 5 |
| Oranges ${ }^{1}$..........................................tons | 6.4 | 11.1 | 449 | 2 | 1,676 | 7 | 13 |
| Oranges ${ }^{12}$.....................................tons | 3.4 | 5.9 | 298 | 2 | 917 | 7 | 10 |
| Rice ..................................................cwt | 2.7 | 4.7 | 4 | (Z) | 13 | 10 | 10 |
| Sorghum for grain ........................... bushels | 6.6 | 11.4 | 20 | (Z) | 105 | 9 | 11 |
| Soybeans for beans ........................ bushels | 2.1 | 3.6 | 48 | 8 | 109 | 11 | 9 |
| Upland cotton ${ }^{1}$..................................bales | 5.0 | 8.7 | 786 | 145 | 1,675 | 12 | 8 |

[^10]Quantity is in thousands of units.
${ }^{2}$ Excluding freeze and hurricane seasons.

## Access to NASS Reports

For your convenience, you may access NASS reports and products the following ways:
> All reports are available electronically, at no cost, on the NASS web site: http://www.nass.usda.gov
> Both national and state specific reports are available via a free e-mail subscription. To set-up this free subscription, visit http://www.nass.usda.gov and in the "Follow NASS" box under "Receive reports by Email," click on "National" or "State" to select the reports you would like to receive.

For more information on NASS surveys and reports, call the NASS Agricultural Statistics Hotline at (800) 727-9540, 7:30 a.m. to 4:00 p.m. ET, or e-mail: nass @ nass.usda.gov.

The United States Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, political beliefs, genetic information, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD).

To file a complaint of discrimination, write to USDA, Assistant Secretary for Civil Rights, Office of the Assistant Secretary for Civil Rights, 1400 Independence Avenue, S.W., Stop 9410, Washington, DC 20250-9410, or call toll-free at (866) 632-9992 (English) or (800) 877-8339 (TDD) or (866) 377-8642 (English Federal-relay) or (800) 845-6136 (Spanish Federal-relay). USDA is an equal opportunity provider and employer.

# USDA Data Users' Meeting 

Monday October 22, 2012

Crowne Plaza Chicago-Metro<br>Chicago, Illinois 60661<br>312-829-5000

The USDA's National Agricultural Statistics Service will be organizing an open forum for data users. The purpose will be to provide updates on pending changes in the various statistical and information programs and seek comments and input from data users. Other USDA agencies to be represented will include the Agricultural Marketing Service, the Economic Research Service, the Foreign Agricultural Service, and the World Agricultural Outlook Board. The Foreign Trade Division from the Census Bureau will also be included in the meeting.

For registration details or additional information for the Data Users' Meeting, see the NASS homepage at http://www.nass.usda.gov/meeting/ or contact Vernita Murray (NASS) at 202-690-8141 or at vernita_murray@nass.usda.gov.

This Data Users' Meeting precedes an Industry Outlook Meeting that will be held at the same location on Tuesday October 23, 2012. The Outlook meeting brings together analysts from various commodity sectors to discuss the outlook situation. For registration details or additional information for the Industry Outlook Meeting, see the Livestock and Marketing Information Center (LMIC) homepage at http://www.lmic.info/ or contact Erica Rosa 303-236-0461 at rosa@lmic.info or Laura Lahr 303-236-0464 at lahr@lmic.info.
