### **ACKNOWLEDGEMENTS**

The publication of this bulletin was made possible through the efforts and cooperation of many individuals as well as private and governmental institutions. To all of them the Florida Crop and Livestock Reporting Service wants to express its appreciation.

Many farmers and agricultural enterprises have voluntarily supplied information to develop these statistics. The Agricultural Stabilization and Conservation Service has been a source of much basic data on crops under U. S. D. A. programs. Others contributing information were the Florida Department of Agriculture, Agricultural Experiment Stations and Cooperative Extension Service.

This bulletin is published by the Florida Crop and Livestock Reporting Service, a cooperative agency of the Statistical Reporting Service, U. S. D. A., Florida Department of Agriculture; and Florida Agricultural Experiment Station. Acreage, production, and value data are official statistics prepared by the Florida Crop and Livestock Reporting Service.

## SUMMARY OF THE 1973 FIELD CROPS SEASON

This publication, released annually, contains statewide estimates of acreage, yield, production, price and value of production for all major field crops grown in Florida for the years 1968 through 1973. County estimates for corn, wheat, soybeans, peanuts and tobacco are also shown for these years. County estimates for the major cotton producing counties are shown for the years 1972 and 1973. The complete series of crop estimates for the State is available from this publication, "Field Crops Summary, 1972" and the publication "Field Crops Summary, 1919 - 1967". All of these publications are available upon request.

The 1973 season was a fair year for most field crops grown in Florida. A record yield was made for peanuts, but for most crops, yields were about average. Season average prices were at record or near record levels for practically all major crops. The value of production for each crop except shade tobacco and wheat was higher in 1973 than in recent years.

The rainfall and temperature conditions were variable during the year. January was relatively mild but February was colder than normal. On February 10-11, parts of North and West Florida received the heaviest snowfall in 15 years, with 2.00 inches reported at Pensacola and flurries as far South as Pasco County. The early spring was generally dry and irrigation was used where available. Planting of spring crops was delayed in many areas. During the summer months scattered rainfall provided needed moisture in many areas while heavy showers in other sections leached fertilizer from the soil, reduced yields and lowered crop quality. Because of localized nature of the rainfall wide variations in yields were experienced with some areas having record yields while others were having near crop failure. The fall brought generally dry weather which was near ideal for harvesting crops. A cold front moved into the State during mid-November bringing freezing temperatures to western and northern areas but causing no damage to remaining crops. Freezing temperatures on December 12 and in mid-February caused some damage to the sugarcane crop.

Acreage planted to field corn in 1973 increased nearly 10 percent over 1972, reversing the downward trend of recent years. The average yield per acre was 43 bushels, 3 bushels below the year before. Total production of 14.6 million bushels was just slightly above production in 1972. However, with a season average price of \$2.55 per bushel the total value of the crop at 37.3 million dollars was almost double the value of the 1972 crop. The corn crop was second only to sugarcane in value of production in 1973.

The value of the sugarcane crop at 190.9 million dollars was the highest valued field crop produced in Florida in 1973 and exceeded the previous record high value set in 1972, by 68.2 million dollars. The increase in value was the result of a sharp increase in the season average price combined with an increase in harvested acres. Cold weather during

the winter period caused a reduction in yields which fell 6.7 tons per acre from the 1972 crop but were about the same as 1971. Acreage of sugarcane continues to increase with 265.4 thousand acres harvested for sugar and seed during the 1973-1974 season.

Soybeans continued the upward swing and acreage increased for the 12th consecutive year with 254,000 acres harvested in 1973. The soybean crop ranked third in the State in acres harvested and moved up to third in value of sales. The sales of 34.4 million dollars, were almost double the value in 1972. The sharp increase in value was due to an increase in season average price, the gain in harvested acres and a higher yield per acre. The average yield in 1973 was 24 bushels per acre -- up 3 bushels from the 1972 yield. The western portion of the State continues to dominate in acreage devoted to soybeans.

Florida producers harvested 188,000 acres of hay in 1973 which produced 367,000 tons of hay for the State's livestock industry. Hay yields averaged nearly 2 tons per acre, up slightly from 1972 but the same as 1971. The season average price of \$43.50 per ton, up \$6.50 per ton from 1972, produced a crop value of 16.0 million dollars.

The State's cotton production totaled 12,500 bales, down 1,000 bales from 1972. The decline in production was due to lower yields as harvested acres increased slightly from a year earlier. The 1973 yield of 522 pounds of lint per acre was 50 pounds less than in 1972. The value of production in 1973 of 3.1 million dollars was up 65 percent from 1972. The higher value was due to a sharp increase in the season average price. Santa Rosa county continues to lead in cotton production, accounting for 89 percent of the State total.

The downward trend of acreage planted to peanuts continued as fewer acres were planted for "hogging off". The peanut acreage harvested for nuts was up a thousand acres from a year earlier and together with higher yields resulted in a 9 percent increase in total production. A record yield of 2,735 pounds per acre was realized. This surpassed the previous record set in 1971 by 145 pounds. The increased average price received at 16.4 cents per pound raised the total crop value to 24.7 million dollars -- up 4.6 million from 1972.

In 1973, flue-cured tobacco acreage increased from 10,100 acres to 11,000 acres while shade tobacco acreage dropped from 2,400 acres in 1972 to 2,100 acres. Yields of both flue-cured and shade tobacco were lower than last year. The season average price of 88.0 cents per pound for flue-cured tobacco combined with the higher production resulted in a total value of 18.5 million dollars -- up 1.6 million dollars from 1972. The shade tobacco price of \$3.50 per pound was higher than previous years resulting in a total value exceeding the 1972 value by 2 percent even though production was down by 18 percent.
