FOREWORD

The Florida Crop and Livestock Reporting Service functioning as the field unit of Agricultural Extimates of the Bureau of Agricultural Economics, United States Department of Agriculture in cooperation with the Department of Economics, Agricultural Experiment Stations, University of Florida, again submits its annual summary of statistics on Florida's vegetable crops.

This publication is the 8th in a series, and its presentation, with its seven preceding volumes, was made possible through the joint efforts of these two agencies. Through this cooperative agreement it has been possible to expand the statistical coverage of the Department to include county production as well as production costs in specified areas. Shipment data are again presented through the cooperation of the Federal-State Marketing Bureau. Most shipments have been traced to the county of origin.

Minor adjustments have been made throughout this publication as a result of the 1950 U. S. Census. Baby limas and butterbeans are now included in the regular lima bean estimate where formerly fordhook type only was included. Sweet corn is now an official part of crop estimates since it has been established as a very important phase of Florida's commercial vegetable production. On the other hand, carrots and green peas (English) have been discontinued due to relative unimportance. Shipment data are shown on miscellaneous crops such as okra, radishes, field peas, and bunched vegetables, but acreage and production data are inadequate to make current estimates on these minor crops.

One of the main purposes in preparing regularly scheduled Government Crop Reports and Truck Crop News releases is to keep growers, shippers, and other interested parties informed on such timely topics as total production, current yields, harvesting periods and general conditions from an unbiased viewpoint.

We gratefully acknowledge our indebtedness to each person and organization contributing to the development of these data. Their cooperation makes these reports possible. With the exception of shipment information, the data contained in this publication are estimates and are based on reports by, and interviews with growers, shippers, marketing associations and organizations, seedsmen, railroad representatives, canners and other processors, the Agricultural Extension Service through its county agricultural agents, the Federal-State Inspection and Market News Service, the Florida State Marketing Bureau, the Florida State Marketing Board, the Production and Marketing Administration and other well informed sources. To each and all of you we again say a grateful "Thank You."

Each crop generally carries the following sequence of data by season: Name of crop - Season; Acres for harvest, by Counties; Acreage, production and value - State summary; Acreage and production by counties and areas, 1951-52; Shipping data; Per acre costs and returns. Crops that harvest in more than one season are combined in one total grouping classified as "All" and placed before the breakdown by seasonal groupings. Yellow pages are placed mainly as dividers between crops with per acre cost and returns on or adjacent thereto.

DEFINITIONS AND EXPLANATIONS

SEASONAL GROUPINGS - In order that competitive production within the State of Florida and the United States may be classified on a National basis under reasonably uniform groups, we have established a National pattern which is based on the most active harvesting periods. These major groups are WINTER, SPRING, SUMMER, and FALL. The WINTER group includes the months of January, February, and March; SPRING includes April, May, and June; SUMMER includes July, August, and September (Florida carries no official summer commercial crops); and FALL includes October, November, and December. These periods are not rigidly fixed and the harvesting period for a particular grouping may extend over into the preceding or following group. However, in arranging our data we have followed these groupings in so far as it is practical. For example, it has been considered practical to carry cabbage, cauliflower, escarole, lettuce, and strawberries as one season crops, designating them WINTER since the volume production is harvested generally during January, February, and March. Since some systematic order of grouping is necessary it is deemed best for all concerned to handle our classifications on a National basis even though they may not always agree with some local designations now in use.

PLANTED ACREAGE - The definition for planted acreage is based on a "loss of crop" concept. Estimates of planted acres for any seasonal grouping consist of acres for harvest (see next page) during that particular seasonal group plus any acreage planted for harvest during the season, but which was lost or destroyed and did not produce a crop in the season under consideration. If the acreage is lost and not replanted it is counted as planted. If it is lost but replanted for harvest in the same season as the original acreage would have been harvested, the acreage replanted is not considered as additional acreage planted. However, if the acreage lost is replanted for harvest in a later season, it is considered as planted for both seasons and as acres for harvest only for the latter season.

ACRES FOR HARVEST - This is considered as being all acreage from which a crop could have been harvested had economic conditions (prices, available labor, etc.) warranted the harvest. It includes mature acreage on which the harvest was postponed or

delayed too long due to economic reasons and the production lost thereby. Acreage which produces such low yields or poor quality that the crop is not worth picking at any reasonable price is considered as crop failure and is not included in the acreage for harvest. Unharvested acreage which produces yields which would be harvested at reasonable prices is included in acreage for harvest.

YIELD - Yield refers to total production of merchantable quality produced on an acre basis and may include some unharvested production left in fields for economic reasons.

PRODUCTION - Total production represents the yield times (X) the acres for harvest. Production of value is that part of the production which was harvested and sold or utilized and does not include economic abandonment.

ECONOMIC ABANDONMENT - This category includes mature production not harvested because of economic factors, such as low prices, shortage of labor, etc. Such loss of production includes quantities left in fields partially harvested as well as production on acreage abandoned for economic reasons. Acreage abandoned at any stage of growth before maturity will be considered as loss of acreage or crop failure rather than economic abandonment of production.

UNIT VALUE OR PRICE - All prices used in this report are on an F.O.B. basis or its equivalent, less selling charges. In the case of some commodities which are sold in units other than the one listed, these units are converted into the equivalent of the ones used.

TOTAL VALUE - The total value is the price per unit times (X) the production of value.

CANNED OR PROCESSED ACREAGE AND PRODUCTION - The acreage of vegetables in Florida planted solely for canning and other processing purposes during the period covered by this publication has been confined principally to cucumbers for pickles. The acreages of beans and tomatoes, the principal crops canned, are planted primarily for fresh market, but during recent years, substantial quantities have been canned or frozen. In order to show the utilization of the production from the acreage brought to harvest, three columns on production are used in the State Summaries. The first shows the total production with a footnote of any economic abandonment; the second shows the production in bushels sold for fresh market consumption; and the third shows the production in bushels sold for processing (either canned or frozen). Those desiring to know the equivalent acreage utilized for processing should divide the number of bushels processed by the average yield then generally round to the nearest hundred. The prices given for processed beans and tomatoes is based on a per ton price and reduced to a per bushel price (rounded to the nearest whole cent).

COSTS AND RETURNS PER ACRE IN SELECTED AREAS IN FLORIDA - These tables represent the summarization of grower records or estimates of costs and returns per acre from several vegetable crops in the major producing areas of Florida for the 1951-52 season as compiled by the Florida Agricultural Experiment Stations. In so far as possible, growing and harvesting costs have been separated and labor items excluded from costs of materials.

MIXED CAR MOVEMENT - Total shipments of produce in mixed cars are shown by months on Page 106. These data include those equivalent cars shown in our regular shipment data under each specific crop carried in this publication.
