ACKNOWLEDGEMENTS

The acreage, yield, production, monthly and season average value, and crop value statistics in this bulletin are official State and USDA estimates prepared by the Crop and Livestock Reporting Service. The county and area detail in these statistics were made possible by the participation of the Department of Agricultural Economics, University of Florida, in the estimating program. Market price quotations and shipment statistics are from the Market News Section and the USDA Consumer and Marketing Service. Other sources of data are cited in footnotes.

Agencies in the Florida Department of Agriculture providing basic data used in developing statistics in this summary include the Road Guard Section, Division of Inspection; State Markets Section, Celery Advisory Committee, and Sweet Corn Advisory Committee, Division of Marketing; the Plant Inspection Section, Division of Plant Industry and the South Florida Vegetable Exchange. County Agents of Florida's Agricultural Extension Service were very helpful in supplying information on vegetable production in their counties.

Growers, shippers, processors, sales agencies, and transportation firms voluntarily supplied much of the data used in developing these official statistics. This public spirited cooperation is appreciated.

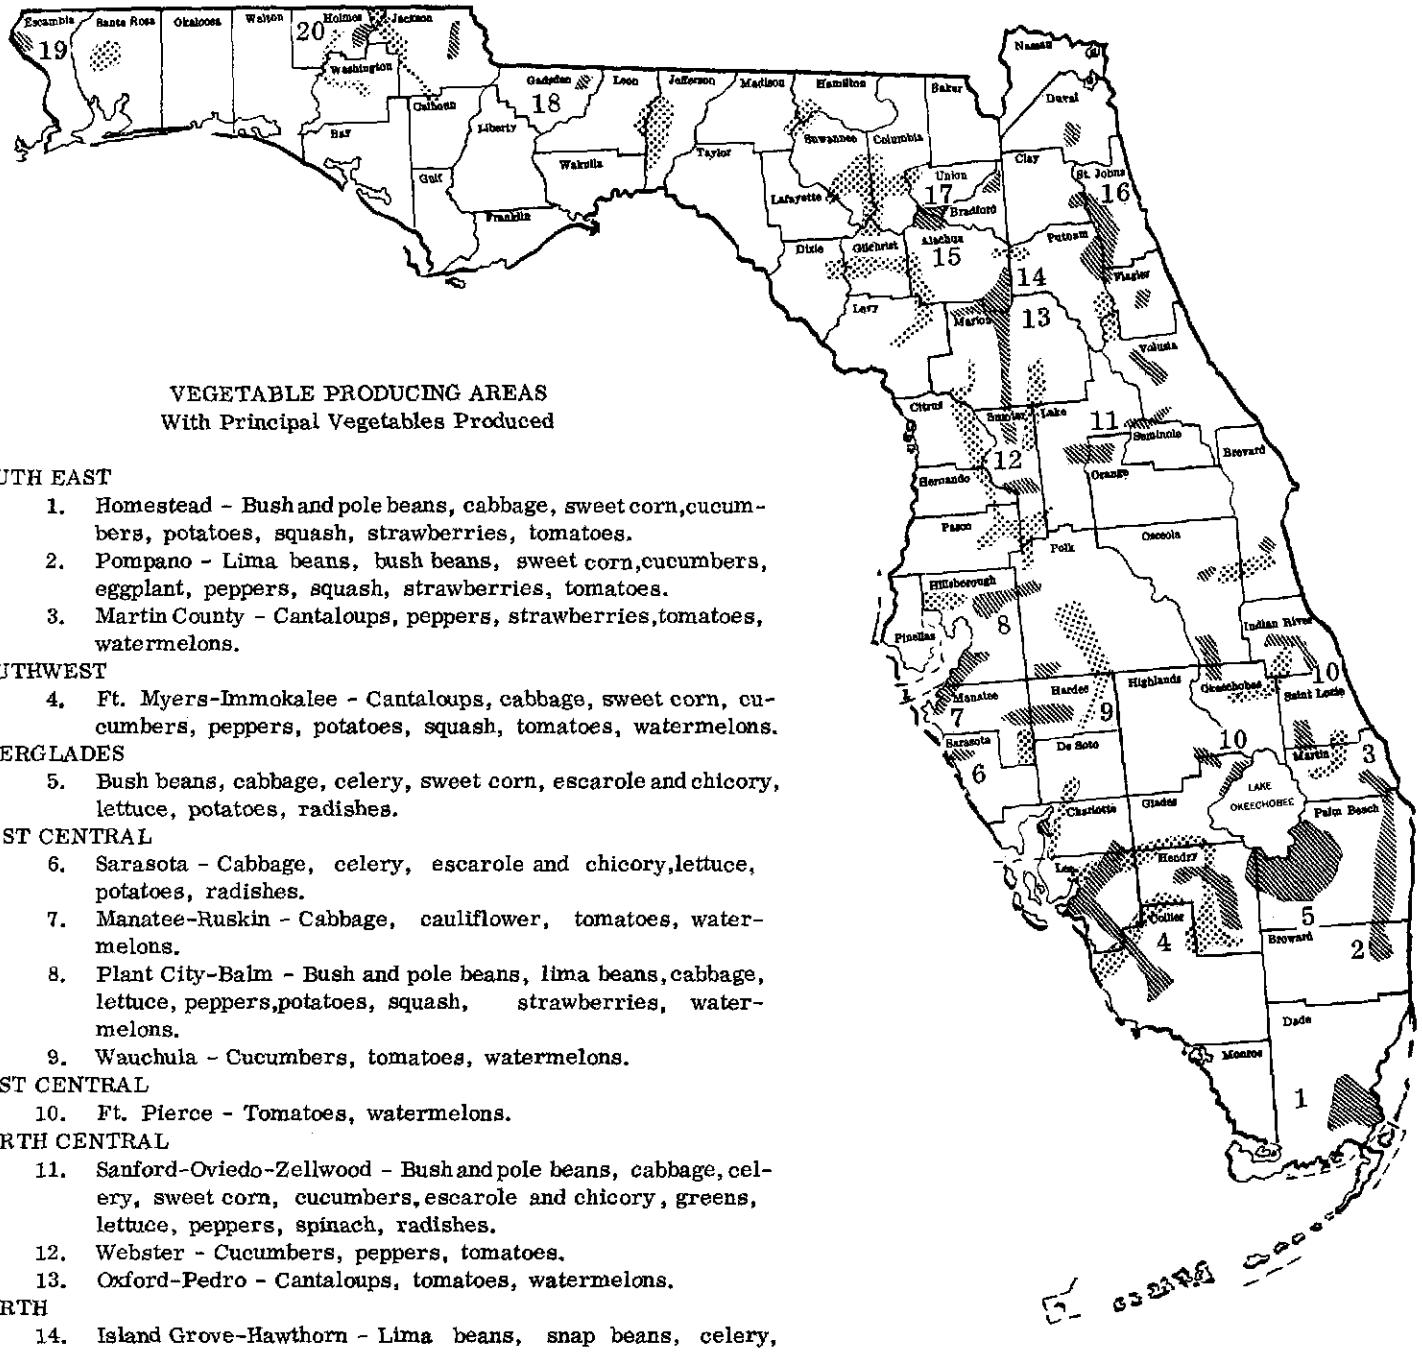
FLORIDA



VEGETABLE PRODUCING AREAS
With Principal Vegetables Produced

SOUTH EAST

1. Homestead - Bush and pole beans, cabbage, sweet corn, cucumbers, potatoes, squash, strawberries, tomatoes.
2. Pompano - Lima beans, bush beans, sweet corn, cucumbers, eggplant, peppers, squash, strawberries, tomatoes.
3. Martin County - Cantaloups, peppers, strawberries, tomatoes, watermelons.

SOUTHWEST

4. Ft. Myers-Immokalee - Cantaloups, cabbage, sweet corn, cucumbers, peppers, potatoes, squash, tomatoes, watermelons.

EVERGLADES

5. Bush beans, cabbage, celery, sweet corn, escarole and chicory, lettuce, potatoes, radishes.

WEST CENTRAL

6. Sarasota - Cabbage, celery, escarole and chicory, lettuce, potatoes, radishes.
7. Manatee-Ruskin - Cabbage, cauliflower, tomatoes, watermelons.
8. Plant City-Balm - Bush and pole beans, lima beans, cabbage, lettuce, peppers, potatoes, squash, strawberries, watermelons.
9. Wauchula - Cucumbers, tomatoes, watermelons.

EAST CENTRAL

10. Ft. Pierce - Tomatoes, watermelons.

NORTH CENTRAL

11. Sanford-Oviedo-Zellwood - Bush and pole beans, cabbage, celery, sweet corn, cucumbers, escarole and chicory, greens, lettuce, peppers, spinach, radishes.
12. Webster - Cucumbers, peppers, tomatoes.
13. Oxford-Pedro - Cantaloups, tomatoes, watermelons.

NORTH

14. Island Grove-Hawthorn - Lima beans, snap beans, celery, squash, watermelons.
15. Gainesville-Alachua - Bush beans, cucumbers, peppers, potatoes, squash.
16. Hastings - Cabbage, potatoes.
17. Starke-Brooker-Lake Butler - Lima beans, snap beans, cucumbers, green peppers, potatoes, squash, strawberries.

WEST

18. Gadsden County - Pole beans, squash.
19. Escambia County - Potatoes.
20. Holmes-Jackson-Washington Counties - Watermelons, miscellaneous vegetables.

Commercial Vegetables Watermelons

1/ Includes Butter Beans. 2/ Includes Pole Beans. 3/ The planting dates apply to seeded and transplanted acreage provided transplanted acreage is backdated four weeks.

DEFINITIONS AND EXPLANATIONS

SEASONAL GROUPS -- Seasonal estimates are made for most of Florida's vegetable, melon, potato, and strawberry crops to show supplies for a shorter period of time than the entire marketing season. The seasonal classification used for each of Florida's crops is shown on a previous page along with usual planting and harvesting dates.

PLANTED ACREAGE is the total acreage which has been planted for harvest during one designated season. To avoid duplication, acreage lost and replanted to the same crop in time for harvest in the same season is counted only once.

HARVESTED ACREAGE is the acreage harvested or partially harvested plus any additional acreage which reached maturity, but was not harvested due to labor shortages, low prices or other economic conditions. Acreage lost before or at maturity through natural causes is not included in the acreage for harvest.

YIELD is the average production of merchantable quality produced per acre and includes any unharvested production left in fields for economic reasons.

PRODUCTION includes the quantity actually harvested plus any quantity that was left due to economic abandonment where losses of this type occur.

ECONOMIC ABANDONMENT is that portion of the crop that reached maturity and is of merchantable quality but was not harvested because of labor shortages, low prices or other economic factors.

PRODUCTION OF VALUE is the total production less the quantity abandoned due to economic reasons.

UNIT VALUE for production sold on the fresh market represents the F. O. B. price received or its equivalent for all grades and quality of the commodity including selling charges. Unit value for quantities sold to processors the 1963 fall crop and for all prior seasons, represent prices paid the grower at the first receiving point. Since that time, value is on a delivered to the processing plant door basis and includes transportation cost, etc.

TOTAL VALUE is the per unit value times the production of value.

WEEKLY F. O. B. PRICE RANGE -- Represents the low and high price received for generally good quality. Prices shown for Pompano are representative of sales at the State Farmers' Market.

RAIL - TRUCK shipments are included in the straight rail shipments shown for each crop.

RAIL LOAD FACTORS -- Represents the average number of packages per rail car based on tabulations of way-bills showing the contents of each car.

MIXED RAIL CARS -- For major commodities the quantity shipped in mixed rail loads is tabulated from way-bills. The total quantity of each commodity is then converted to the equivalent of a straight rail car load.

TRUCK SHIPMENTS are converted to equivalent carlots on the basis of a pre-determined load factor. A minor difference of one or two carlot equivalents in the season total obtained by adding the monthly or weekly shipments exists because of rounding.

PRODUCTION AND PRICE UNIT -- The official USDA vegetable crop estimates are published on a weight basis. For this bulletin the official estimates for most vegetable crops have been converted to the most commonly used container. The following table gives the net weight used per container and the number of containers per hundredweight.

PRODUCTION AND PRICE UNIT
Most Common Unit, Estimated Net Weight, Number of Units per Hundredweight,
Principle Vegetable Commodities, Florida, 1965-66 Crop Season

Cucumbers	Bushel	52	1.923	Tomatoes	Crate	60	1.667

SUMMARY OF THE 1965-66 SEASON

Florida's vegetable, melon, potato, and strawberry production marketed during the 1965-66 season for $256,810,000, setting a record for gross value and was nearly 5 percent greater than the crops sold in 1964-65. Vegetable production accounted for 81 percent of the gross total -- potatoes slightly less than 9 percent, melons 7 percent, and strawberries 3 percent. All commodities except lima beans, melons and berries had gross valuations in excess of 1964-65.

Florida farmers prepare for fall planting and do a considerable portion of their seeding and transplanting in the summer months. Two of the earliest crops to go into seedbeds are eggplant and celery because these are transplanted. The first celery was set during the last 10 days of July, both in the Everglades and Zellwood areas. Sweet corn growers in the Everglades began planting during the first half of August. By the first of August, fall tomato growers were seeding direct to the field. The bulk of these early plantings were for mature green harvest. Snap bean planting, primarily for processing, started in Zellwood in mid-August or slightly earlier. Planting of pole beans in Gadsden County for fresh market was delayed by excessive rains about the same time. Early peppers were seeded direct to the field also in the first half of August and were emerging by mid-month. Early eggplant were being set to the field in the Pompano area during the first half of August but earlier set North Florida "eggs" were growing by that time.

This was a season of extremely variable weather. During August, land preparation and planting was frequently interrupted by showers. By mid-August, some areas had excess soil moisture. On September 7 and 8 Hurricane Betsy passed south of Miami. Winds were in excess of 100 mph and extended over a wide area, affecting vegetables northward to Ft. Pierce. Accompanying rainfall was generally light. On the 9th the hurricane moved through the north Gulf coastal area, bringing considerable rain to the Panhandle. A second tropical disturbance, Debbie, brought generally abundant rain to most areas the last week of September. Planting programs continued except for interruptions by recurring rains and excessive moisture.

On October 14 and 15 torrential rain measuring 15 to 20 inches occurred in North Dade, Broward and South Palm Beach coastal areas. Ft. Lauderdale measured 24.43 inches, surpassing the record 21.05 inches reported in January 1957. Damage was severe to beans and tomatoes. Other tender crops such as sweet corn, cucumbers, eggplant, and peppers were adversely affected. Where plants were not completely drowned, beds were washed and fertilizer leached. The excessive rains missed Central Florida and growing conditions were favorable. A second flooding of the Lower East Coast, particularly Broward and North Dade Counties, occurred on October 23 and 24. The rain measured 10 inches or more with excess of 5 inches over most coastal sections between West Palm Beach and Miami. On October 31, another 5 inches fell with some sections of coastal Broward receiving as much as 10 inches.

November brought a change with generally sunny skies and normal temperatures and only light, scattered showers. All agricultural activity was resumed and efforts were made to replant or to bring crops out of heavy damage. Harvest of early vegetables was widely active during November. The first general frost with freezing temperatures occurred in North and Central Florida on December 1. Harvest of most tender vegetables terminated in North Florida but was already near completion there and in the muck-lands of Central Florida. The important southern areas generally benefited from the cooler weather and production increased. During the second half of December warm days, cool nights and a shortage of rainfall were conducive to active harvest. The first potatoes were shipped from the Everglades in mid-December. Volume of all crops except sweet corn and tomatoes increased during December. January weather was favorable for vegetable production. Harvest was active in most areas with heavy shipments which were not exceeded until April. On January 30-31 below freezing temperatures occurred in most areas. Temperatures ranged from 14 degrees at Tallahassee to just above freezing in warm locations on the Lower East Coast. Soil moisture accompanied by air movement helped to alleviate damage in some areas. However, damage was generally severe extending into southern areas.

Several widespread frosts occurred in February and early March, resulting in light to heavy damage southward to the Everglades area. Hastings potatoes were killed to the ground including most sprouts in pre-emergence stage. The damage delayed maturity and lowered yields on early plantings. All tomatoes in Marion and Sumter Counties were lost and reseeded.

Most of April was dry, warm and sunny, but temperatures fell below normal in early May. Excessive rain in the northern peninsula areas May 9 and 10 was especially heavy west of Gainsville. Frequent showers occurred in all areas until late May. Hastings potato harvest was especially hindered.

Hurricane Alma, earliest of record, moved northward through the Gulf of Mexico on June 8 and 9, crossing the state near St. Marks. Winds 45-60 mph, brought high tides to most coastal points from Santa Belle Island to Carrobelle. Rainfall ranged from 5 to 7 inches in the Lower East Coast, to 3 to 5 inches over the rest of the state east of the Appalachicola River. Volume supplies of watermelons and sweet corn were moving at this time, continuing through June. A fair volume of celery from Central and North Florida continued into early July. Tomato harvest was past peak at the time of the storm. A sharp reduction in volume resulted. By the end of June, only limited quantities of sweet corn, melons and miscellaneous vegetables remained for harvest. Before late spring harvest was completed, fall seedbeds were planted, making a year round activity.

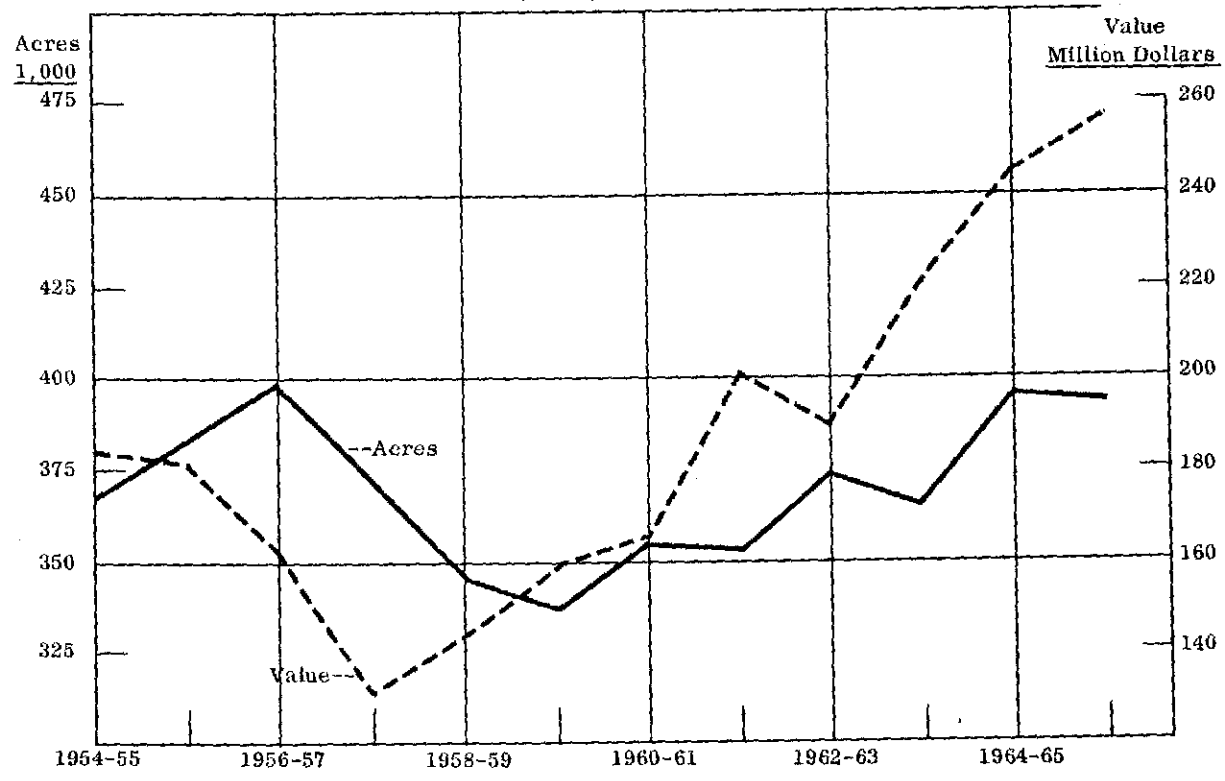
1/ Vegetable crops include Lima Beans, Snap Beans, Cabbage, Celery, Sweet Corn, Cucumbers, Eggplant, Escarole, Lettuce, Green Peppers, Squash and Tomatoes. Cauliflower is included 1949-50 through 1960-61. Spinach is included 1955-56 through 1965-66. Other Vegetables are included 1960-61 through 1965-66.

Vegetables, Melons, Potatoes and Strawberries,
Acreage Harvested and Value of Quantity Sold, Florida, Crop Years 1954-55 through 1965-66



Production of lima beans in Florida continued the low trend established after consumer acceptance of processed limas became a reality. Even the southern trade with their taste for butterbeans could not create a demand strong enough to keep Florida in lima bean production commensurate with earlier production levels. In 1965-66 only 1,000 acres were harvested, a record low.

Production at 91,000 bushels was only slightly less than the 94,000 of the previous year, continuing the downward trend. The average price received was comparable to that of the two previous years. Consumer acceptance for unshelled fresh beans is not sufficient to warrant the risk involved. Economical machine harvest of limas would require a much larger acreage by individual or cooperating farmers. Large scale production would be possible for processing, using mechanical harvesters and could be a possibility in the future. Some interest is already evidenced.

Harvest began in North Florida and Plant City during October and shifted to Pompano for a light movement through the winter and early spring. Heaviest production is in the spring and is grown at Pompano, Plant City, North and West Florida. A good percentage of the production is consumed locally.

Interstate shipments are no longer reported daily, but are combined with other miscellaneous vegetables and separated at the end of the season. A total of 73 carlots were shipped compared to 66 the previous season, and 114 during the 1963-64 season. Sixty carlots moved in May and June, emphasizing the fact that heaviest production is during late spring.

Acreage estimates include lima beans: fordhooks, baby limas and speckled butterbeans.

SNAP BEANS
1965-66

The production of bush varieties of snap beans is increasingly shifting to the Lower East Coast, where hand picking can be supplemented by machine harvesting, overcoming the prevailing labor shortage and its tendency to avoid "stoop" labor. Consequently, fresh market bean growing is decreasing in North and Central areas. Torrential rains in mid and late October drowned most early plantings in the Pompano area. Harvest had not started. Measurable rainfall was from 15 to 20 inches, and locally heavier. The Pompano area normally begins to harvest in early November with continuing supplies into May. Pole beans are grown in Gadsden County for early fall harvest, at Plant City, and in south Dade County. The south Dade crop is a continuous planting with harvest extending over a period from early November through early May. Dade supplies are supplemented from the spring crop at Plant City. Plantings in Gadsden County for spring are normally lighter than fall because labor is actively engaged in the production of shade tobacco.

A cold front on January 30-31 brought damaging temperatures to the Pompano area and harvest was slowed. Production continued but yields were lowered and quality impaired. The Everglades area has increased fall and spring plantings slightly, since a good portion of the crop grown there is for processing and can be successfully harvested mechanically. The Zellwood area produces a fall and spring crop almost exclusively for freezing and canning. Prior to labor difficulties, plantings in both the Everglades and Zellwood were divided between bush varieties and pole beans, the latter mostly of the Blue Lake variety. However, research has provided a quality Blue Lake that takes the place of the pole variety and most of the beans grown for processing are now bush varieties.

The value of the 1965-66 crop at $17,558,000 covered the sales of 4,373,000 bushels for fresh consumption and 817,000 bushels for processing. Acreage harvested during the 3 seasons was 42,500 acres, about 4 percent less than the previous year, but only 54 percent of the 78,000 acres harvested in 1948-49. Definitely the trend has been for reduced acreages for fresh market. Newer varieties and improved cultural practices, insect and disease controls, have increased yields appreciably. Early plantings are made in West Florida in mid to late August with fall beans for processing planted at Zellwood at the same time or slightly later. When Hurricane Alma crossed the state in early June, practically all harvest had been completed except in West Florida. Some damage resulted from rains accompanying the storm.

The value of the 1965-66 cabbage crop at $10,597,000 compared with $7,426,000 the previous year and was exceeded only during the last 10 years by the 1961-62 crop, when the per unit average set a record. Total production at 6,236,000 crates has not been exceeded since 1959-60. The excellent yield of 430 crates exceeds all prior years excepting 1950, 1951 and 1952.

In spite of the reduced plantings, more acres were brought to harvest than in 1964-65. Even though weather was extremely variable, more acreage was lost in 1964-65 in the cold of January 17-18 in the Everglades alone, than was lost during 1965-66 throughout Florida. During that year losses in this important producing area were 2,400 acres with total losses throughout the state estimated at 3,200 acres.

Florida cabbage begins moving to market in November and continues into early June. The heaviest shipments normally occur in April. Though cabbage is mostly set in sandy soils, muckland crops are frequently seeded and thinned. Transplanting continues over a longer period and later in the season in the Sanford-Oviedo-Zellwood area than in other parts of the state.

The important Hastings area was in full production of one of their best yielding crops in years when the freezing temperatures and heavy frost occured on January 30-31. Production was lowered as large sizes were no longer realized. Growers in this area plant most of their crop prior to January 1 in order to get as much production out of the way as possible before potato harvest. Cabbage harvest requires more labor than potatoes require, since machine harvest is primarily used in the latter crop. This area was still harvesting cabbage into early May but in very light amount. The Sanford-Oviedo-Zellwood area starts as early or earlier than any other area in the state, and continues longer. The first usually available is grown in the Zellwood mucklands from acreage seeded in August. Shipments from the Sanford-Oviedo-Zellwood area normally continue through May. West Central counties had less freeze damage than the Everglades northward. Outlying areas from the Everglades mucklands are becoming active with some marketing through the facilities in the muckland area. South Dade County also grows a small acreage which is sold locally and shipped to northern markets.

Hybrid varieties are becoming more common and better yields are often reported. Some of these are in more or less the experimental stage. There are indications of harvesting machines being used in the future and some have been tried already.

CANTALOUPS
1965-66

Acreage planted as well as harvested declined appreciably in 1966. Yields were very good, closing the production gap somewhat. Even so, unit average price was strong--the highest since 1961. Shipments occured mostly during May and June, with a light supply in April.

Acreages were widely scattered and generally small per farm. Especially is this true in Central and North Florida. Methods of sale are varied but run heavily to bulk or per "lope" sale, often in conjunction with watermelons.

A contributing factor to the late season was the necessity for replanting, following the January 30-31 frost and freeze. In mid-April most South Florida crops experienced strong winds, causing some burn.

Crops in Ft. Myers-Immokalee started harvest in early May. The Indiantown area started about mid-May. Even Dade County's small acreage was mostly late. South Florida quality was only fair to good, partly because of locally heavy rains.

In mid-May, Central and North Florida crops benefitted by rain, but some low ground areas were adversely affected. A limited movement from Oxford began in late May but mostly North Florida harvest started in mid-June.

Gross value of celery during 1965-66 at $23,615,000 exceeded that of the previous year by 21 percent, but fell short of the record-breaking 1961-62 season.

The increase was due to multiple reasons. Plantings increased 700 acres with harvest from 600 acres more than in 1965. Yield at 676 crates averaged 4 crates per acre above last year. The record was established for Florida in 1954-55 when 767 crates per acre were produced. The per unit price at $2.91 exceeded that of any previous year except 1961-62.

Harvest began about November 1 in the Everglades and was continuous through mid-June. An estimated 80 percent of the State's production is grown in these important mucklands. During the late October rains, blight control was difficult, but cooler weather in early November was beneficial. Early sizes were small, but favorable weather improved both size and quality. Cold damage January 30-31 was limited. Some slipped skin, pith, and brown stem resulted, making more selective packing necessary. This condition persisted through most of February but by mid-March quality was good to excellent. However, by late April the potential threat of "seeders" in the Everglades, as well as other areas made premature harvest necessary with resultant smaller size and reduced yield. By the third week of May several Everglades growers had completed harvest, and volume declined until completion the second week of June.

Zellwood divides production into the small early fall crop, which harvests during November, finishing by mid-December. Blight and black heart gave trouble at first but good quality was harvested the balance of the early season. Spring planting started in mid-January and harvest began in late April and continued through May and June.

Sanford sandland celery harvests as a winter crop. Oviedo harvests winter and spring. Sarasota harvest ran from early January through the third week of May. Island Grove plants only for spring harvest.

The Florida Fresh Fruit Exchange administrates the celery marketing order. Their field supervisors provide planting, harvesting, and production data. In cooperation SRS assembles these data into weekly reports to the participating industry.

SWEET CORN
1965-66

Sweet corn production during 1965-66 was marketed for $21,237,000, practically the same value as the previous year. The 55,200 acres for harvest was 5 percent more than was harvested the previous year. Fall production came from the Everglades area almost exclusively and was about 10 percent more than the previous fall. As winter supplies declined in the Everglades, they were supplemented by heavier supplies from the Pompano area, and lesser quantities from Ft. Myers and south Dade County. Nevertheless, quantities marketed were appreciably less than the winter of 1965. In the spring, emphasis again shifted to the Everglades where supplies were quite heavy in May. Approximately 30% of the corn acreage ready for harvest from May 5 to May 18 was abandoned due to adverse market conditions.

Field men employed by the Sweet Corn Exchange obtained acreage planted, and weekly reports were issued by the crop reporting service.

Harvest in the Everglades started the first week of October. At Pompano heavy October rains necessitated very little replanting. The January 30-31 freeze killed practically all corn knee-high and smaller in the Everglades, including some on the well protected islands of Lake Okeechobee. Helicopters were used to prevent cold from settling, preventing an even greater loss. At Pompano, corn in the tassel stage was severly burned and at Ft. Myers, acreages remaining for harvest were killed. Production prospects were reduced in Dade County. Most of the Dade crop harvested after April 1, and Pompano and Dade had heavy volume into the second half of April, declining in early May. The Everglades had heavy May harvest supplemented by declining East Coast volume, and supplies were excessive.

Zellwood began spring planting in late February and was active through March, declining in late April to early May completion. Harvest started May 23 and became general by June 1. Volume supplies continued available into early July. Small acreages were grown in North Florida.

1/ Includes small acreage harvested in November

Cucumbers estimated herein are both table stock and pickles for overnight dill utilization. Both are considered fresh market supplies. Pickles for saline solution storage, for sterilized process, and the many other types of utilization other than overnight or quick dill are included in miscellaneous crops.

Total value of production was nearly 13 million dollars, exceeding that of the previous year by about 15 percent. Fall and spring seasons dominate production.

Fall cucumber harvest began late summer in south Dade County. This small acreage, grown mainly for local market, was damaged by hurricane rains. Early fall crops are normally grown in scattered light acreages of North and Central Florida. Arcadia-Wauchula produce a sizeable acreage. Pompano-Martin comes in slightly later, but Ft. Myers-Immokalee are important producers each fall. Immokalee growers had a small early acreage that began to pick during the second week of October. About the same time, pickle stock began to pick at Sanford-Zellwood, and table stock at Wauchula. By early November the Webster area harvest was declining.

Peak fall production was reached in the Pompano-Martin area in early December as Wauchula and other Central points neared completion of harvest. South Florida production was heaviest in January. The freeze of January 30-31 killed all that were unprotected at Ft. Myers-Immokalee. This freeze killed Martin County cukes and damaged young plantings in the Pompano area. Most replants and plantings saved were growing favorably by March. Webster acreage was not up to be damaged by the March 7-8 frost.

Limited spring harvest had started by the week ending March 19. Plantings were coming up to a stand in North Central counties and by late March were up in North Florida. Peak harvest for spring was during the third week of April. Shipments were the highest of the entire crop year.

In early May, south peninsula points were declining rapidly, Wauchula was in heavy volume, and North Central points had started both table stock and pickles. During the third week of May harvest became quite general in North Florida. As late as May 21, at least a light supply was being harvested in practically all areas and volume was still fairly high. After June 1 only limited harvest occurred over Central and North Florida.

EGGPLANT
1965-66

Florida eggplant are in some stage of production each month of the year, and are being marketed ten months or more of the year.

The first car shipped was reported in September from North Florida. A small acreage in Gadsden County started harvest in September.

Shipments were heavy in December and January, but heaviest in April. Reduced supplies during the winter months were supplemented by imports, mostly through Florida ports. These were heaviest in February and March. Prices received reflected supplies available except in January which was higher than in December, even with some increase in volume. The low temperatures of January 30-31 caused considerable bloom and fruit drop. Shipments (with imports removed) were reduced appreciably and markets strengthened, climbing to $3.45 per bushel in March, the highest monthly average of the crop year. This was understandable since shipments were the lowest during March of any month, except October and July, the starting and clean-up months.

Acreages are planted over a widely scattered area, with heaviest concentration in the Pompano area. About 80 percent of the production sold was grown in this important section, from about two-thirds of the state's acreage for harvest. The balance of the crop, grown mostly in the fall and spring, is produced in North, Central and West Central Counties. Alachua and Hillsborough are the heaviest producers, other than the Pompano area.

Yield of 528 bushels is a record for an entire crop year, but some seasonal averages have been higher. Pompano growers are able to harvest over a longer period than those in other areas, primarily because of the warmer climate. Harvest in recent years starts early, often in October and continues into early June. This is the primary reason for their above average yields and high percentage of production.

The 1965-66 production sold was valued at $2,719,000 compared to $2,238,000 the previous year, a record for Florida.

ESCAROLE
1965-66

Escarole and chicory or endive is grown primarily in Florida muckland soils. Harvest is over a long period. It's use is primarily that of a salad green and it is frequently spoken of as "the leaf crop".

The acreage harvested during the 1965-66 season was an all-time high of 8,100 acres, exceeding the 7,800 acres harvested last year. Average yield of 400 crates, produced a record 3,240,000 crates. This yield has been exceeded many times but smaller acreages held production down. Prices received on an f. o. b. basis were quite variable, depending on the demand and supply. Shipments in February following the January 30-31 frost and freeze were lower than any other month and price per unit average at $1.80 was the highest. The movement in March and April was equal to 17 percent of the year's total but the March average value was 40 cents higher per crate than that received in April. Total value was estimated to be $3,888,000. This was higher than the previous year but does not set a record.

Two-thirds of the production came from the Everglades. Harvest of chicory started October 22, and escarole was expected by November 1 from seedings about September 1. Harvest was active until about May--then declined to the end of the season, about June 1.

Cool nights in late November improved growing conditions, that were lowered by late October rains and high temperatures. At intervals the weather was too warm for best progress, even in January. By March, quality had improved substantially and held reasonably well the balance of the season.

Central Florida, primarily Zellwood, produced 29 percent of the crop. Although an attempt is made to have some supplies all season, actually the bulk of the production is divided between fall and spring, but all is carried in the one winter estimate. Some early seeding occured in late August with first harvest in mid-October, gradually increasing to fair volume by November 1, but decreasing rapidly after mid-December. Limited plantings continued for mid-season, harvest slowly increasing in late January, becoming general through March, to terminate in mid-April. Some salvage occured from limited Central Florida supplies following the January 30-31 freeze. Frost March 7-8 burned leaves but most fields were wet which minimized damage to the extent that it grew out reasonably well. In early April harvest was increasing and by the 25th was active throughout the area. In May this area was the principal source of supply until the end of the season.

The balance of Florida production was grown at Lake Placid, Sarasota, and a small local market acreage in Dade County.

Florida lettuce growers marketed production from an estimated 4,000 acres--380,000 hundredweight valued at $2,622,000. This was an increase over the previous year in acres harvested, volume produced, and value of sales. The average per unit value alone was less. A record was set on acreage, production, and value.

Various varieties were grown. Romaine apparently leads, with Iceberg, Boston, leaf and Bibb making up lesser percentages. Definitely, leaf and Bibb were in the minority. Each variety or type is packed in a container, common primarily to that particular lettuce, and each has a different weight. Because of this, production is published in hundredweight. The following net weights are most commonly used for the various containers when converting to hundredweight: Romaine 25, Boston 20, Iceberg 35, leaf 20, and Bibb 10 pounds. Commonly used containers are Eastern lettuce crates for Boston; Universal wirebound crates for Romaine; leaf lettuce is packed in 16-quart baskets and 4/5-bu. tangerine crates; Bibb lettuce is packed in 12-quart and 16-quart Climax baskets; Iceberg is packed in 2/3 or 1/2 LA crates, usually with 2 dozen heads per crate.

The Everglades area produced about 53 percent of the state total. Of the equivalent carlots reported by Market-News Service, 58 percent was Romaine, 28 percent Boston, 6 percent leaf, 5 percent Iceberg and 3 percent was Bibb.

Early seeding began in the Everglades in late August, and part of the acreage up was replanted after the passing of Hurricane Betsy. The extreme cold on January 30-31 damaged all lettuce growing in the Everglades Area. Some fields were lost, and others required selective harvest and heavy stripping. Quality gradually improved to fair to generally good in March and April. Declining supplies in May reflected the warm weather.

Central Florida produces the earliest lettuce of the state with various varieties available at Zellwood in the fall, and Iceberg, Boston and Romaine at Sanford, Samsula and Webster. Harvest started at Zellwood in mid-October and continued in volume through November, declining in early December on all but leaf and Bibb.

April supplies increased in Central areas and continued available, primarily at Zellwood, until early June. Lake Placid-Sarasota specialized in types other than Iceberg and harvest was relatively steady from December into April.

GREEN PEPPERS
1965-66

Peppers produced and marketed from Florida's 1965-66 crop sold for an estimated $19,058,000. More acreage was planted and harvested, but yields were less than the previous year.

Harvest is over a period extending from mid-October through most of June. The most important areas are in South Florida where harvest continues for a long period and about 80 percent of the production was grown. Prices were very good through most of the fall, winter and early spring months; May and June were considerably lower.

Pompano and Martin County produced an estimated 48 percent of the total crop from 45 percent of the acreage harvested in the state. Economic factors, primarily labor shortage, necessitated leaving about 9 percent of this particular area's production in the field. Hurricane Betsy brought early wind and rain, and unprotected fields were lost and replanted. Damage was less severe in Martin County but considerable "damp off" occurred later. In mid-October torrential rains, 15 to as much as 25 inches, flooded fields, drowned crops, washed beds, damaged root systems, and leached fertilizer. Martin County escaped this deluge. A second and third torrential rain hit the Pompano area in late October. Some damage occurred also in Martin County and caused some loss of acreage. Considerable reseeding of early peppers was necessary and harvest was delayed, since fields that survived were set back and damaged.

Ft. Myers-Immokalee growers produced and marketed one-third of the state's total volume from nearly 6,200 acres. Excessive rain and high temperatures prevailed during October, while strong winds and little rain characterized November. Harvest began in November but continued relatively light during December. The freeze of January 30-31 damaged the crop severely and supplies were light through the balance of the winter. Some spot resetting was necessary on younger plantings. Spring production was good with volume after mid-April increasing to peak by the end of April. The seasonal decline started in early May and harvest was practically complete by the end of the month.

West Central counties produced a small fall crop which terminated with the first killing frost. Spring production got underway in mid-May and peaked around the first of June. North-Central production occurred primarily in late May and June. Sanford grew a small fall crop. Samsula, Sanford, Webster and Zellwood were the active spring producing points of this area. The season closed with production centering in North Florida.

Potato production during 1965-66 at 6,294,000 hundredweight exceeds all seasons except 1956 and 1957. A higher yielding crop in 1956 from an acreage only slightly higher produced over 7 percent more. In 1957 the winter acreage was the highest of record, making the combined winter-spring acreage for harvest a record high. However an average yield that year of 140 cwt. curtailed production, all of which was not harvested.

Florida production is divided into 3 seasonal groups--winter, spring-Hastings area, and spring-"other". Harvest of the winter crop started in the Everglades in December, with "reds" at Ft. Myers in production by about February 1. White-skinned varieties started later. The "whites" sustained rather severe damage from the low temperatures of January 30-31, lowering production throughout the area. "Reds" were more mature and sustained much less damage.

In Dade County, harvest got underway in late February. The January 30-31 cold damage was confined to foliage burn. Some of the worst hit fields may have had some reduction in yield from the cold. Prior to any seeding Hurricane Betsy brought in a tidal wave that saturated some fields with saline deposits which did not wash out, even with excessive October rains. An estimated 300 acres were lost completely and yields were lowered on many others. The Dade crop is planted heavily to "reds" but in recent years a change-over to LaSoda and LaRouge varieties has been made. Apparently, the latter is more desirable for chipping than varieties grown in the past.

The freeze of January 30-31 froze all emerged plants at Hastings to the ground and some underneath the surface. Some few were replanted. Late May showers delayed harvest, reduced quality and accelerated grass and weed growth, making digging difficult. An estimated 500 acres were abandoned. A considerable percentage of the production in this area is grown under contract to the chipping industry. Such contracts were most helpful in maintaining an overall average above the open market price.

Other producing areas are located in West Central, North and West Florida. Acreages in the latter two have declined sharply in recent years. In West Central counties, potatoes were vulnerable to frost and freeze of January 30-31, especially at Balm and Plant City. These crops were damaged but most came out to produce low yields. North and West Florida crops dug very slow and some were abandoned because of weather and market conditions.

SPINACH FOR PROCESSING
1966

Spinach for processing during the winter of 1966 was grown on Central Florida mucklands, mostly Zellwood, in Lake and Orange counties. Growers planted 2,700 acres, the same as in the previous season, but acres harvested at 2,500 exceed that of the previous year by 47 percent. Yields were better, making the tonnage 128 percent greater than the previous year's low.

Price per unit is based on a usable ton delivered to the processing plant. Prices prior to 1964 represent the amount paid the grower at the first receiving point. Utilization is mainly confined to southeastern states, mostly Alabama, Florida and Georgia.

The 1965-66 season was one of the best years for production. The freeze of January 30-31 caused little damage, and cold weather was beneficial in controlling weeds.

Spinach: Acreage, Production and Value in Florida, Crop Years 1961 through 1966

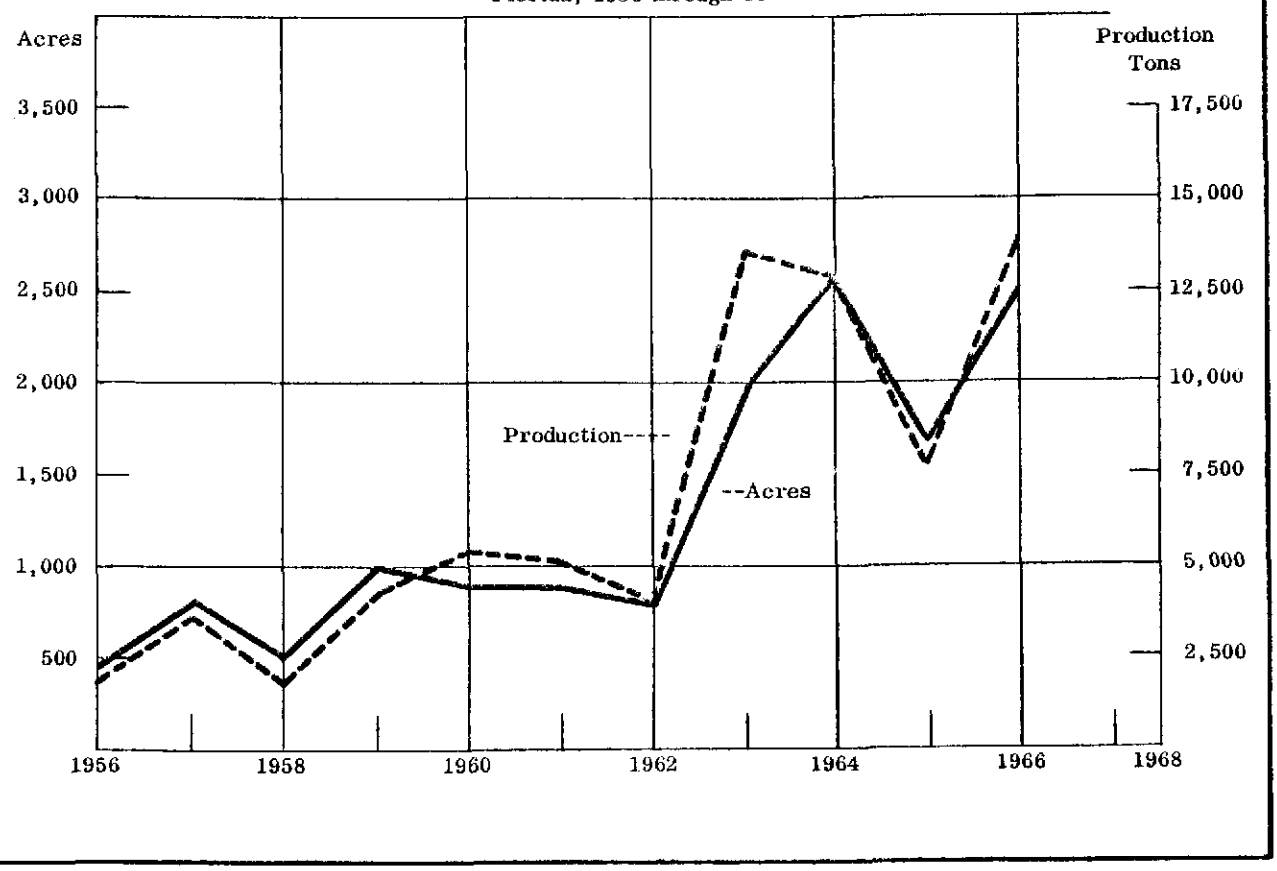
Spinach: Acres Harvested and Production, Florida, 1956 through 1966



SQUASH
1965-66

Squash production at 1,355,000 bushels, from an estimated 10,000 acres harvested, sold for $4, 702,000 only 2 percent more than the previous years value. Various varieties are grown statewide for local and out of state markets.

Soft squash (yellow straightneck and green or Italian) are generally preferred by northern markets. Hybrid varieties have proven very popular because they are heavier yielding. Hybrid zucchini has become so popular it has almost forced out production of cocozells, once grown in volume. These varieties are grown at Pompano, Ft. Myers-Immokalee, Sanford, and in North Florida.

Acorn and butternut (hard squash) for baking are grown at Ft. Myers-Immokalee and in much less quantity in the South East Coastal areas. A good volume is marketed through Pompano facilities. Fall harvest is usually stored and shipped as demand warrants, often moving well into winter.

Packaging depends to a great extent on variety. Most YCN are packed in bushel hampers. White yellow straight, and green of No. 1 quality and size are packed in 5/9-bushel wire-bound or 1/2-bushel baskets. No 2's are usually in bushel baskets or Universal crates. Acorn and butternut are also packed in the Universal crate--a 1 1/9 bushel wirebound.

In the South East coastal areas, planting for fall harvest began mostly after Hurricane Betsy had passed. The mid-October torrential rain, locally up to 25 inches, drowned many plantings in the Pompano area in particular.

In Dade County YCN ranged in price from $2.50 to $10.00 per bushel per hamper for the first grade quality. The highest prices prevailed after the January 30-31 freeze. Lowest prices were in April. March 28 was the peak day of shipping for Dade County. Lack of pickers caused many fields to run to large sizes. Season harvest decline was rapid in late April.

Central and North Florida had light supplies in the early fall, harvest beginning in North and West Florida in early September, but then curtailed by excessive rains in late September and early October. Most of these scattered plantings continued in limited production until terminated by frost. Plant City had an important early spring crop planted heavily to YCN. Harvest got underway the second week of April. Quality and yields ranged good to excellent. Limited supplies of green and whites were available. Scattered plantings northward, mostly in the McIntosh-Citra area and north of Gainesville came into production in late April and continued most of May.

STRAWBERRIES
1965-66

Florida strawberry production during the 1965-66 season at 20,930,000 pounds sold for $7,964,000, fifteen percent less than the previous season's total value. Production was down nearly 18 percent, while acres harvested were an estimated 28 percent less. Resulting value per unit averaged higher--.381 compared to .364 the previous season. Labor shortages forcing economic abandonment the previous season, no doubt influenced growers in planting less in 1965-66.

The heaviest volume was produced along the Lower East Coast, where slightly more than 10,000 pounds per acre were harvested from 1,100 acres. The first berries of the season came from this area in December, continued light during January and February, to peak in early March. Quality was fair to good but sizes were small. January 30-31 low temperatures did little damage, but rain in mid-March reduced quality. High temperatures in April hastened the end of the season.

Central West Coast counties produced an estimated 7,204,000 pounds from 840 acres. December January weather was favorable and quality was good. January 30-31 sub-freezing temperatures killed bloom and some small berries. By the third week of February, harvest was again active. Peak level was maintained through March 15-25, declining as the season drew to an early April close.

North Florida had early berries in prospect in late December and a few were picked for local market in January. Frost January 24 set the crop back but January 30-31 froze all hopes for early supplies. Bloom began to show in late February but frost and freeze March 7-8 knocked many of them off, though plants remained healthy. Harvest got underway the week of March 20 and continued into May. Commercial harvest was mostly over by May 7, and fields were opened to the public.

In addition to shipments by rail and truck, 64 carlot equivalents were transported by air-freight.

TOMATOES
1965-66

Tomatoes are produced in Florida primarily for fresh market. Harvest for canning or processing is a salvage operation after mature greens have been picked, or after vine-ripe harvest is terminated.

Utilization for fresh consumption from fall, winter and spring crops at 12,526,000 equivalent 60-pound crates exceeds all previous years of record. Fresh market sales grossed $69,529,000, about the same as was received from the 6 percent smaller crop of the previous year. Salvage for processing was delivered to Florida plants for $2,030,000. This makes tomatoes a 71.6 million dollar crop, far in front of all other vegetable crops in value.

Vine-ripe tomatoes are grown on stakes or trellises at Pompano and Immokalee-Naples. Early plantings were severly damaged by Hurricane Betsy. Worst damage was caused by wind-blown sand. Recovery was slow at Pompano and is generally attributed to salt spray deposited by hurricane winds. Immokalee fared better and harvest was underway in late November. Acreage there increased, probably as a result of difficulties on the East Coast. Volume was light until mid-December. As replants matured in both areas, volume of vine-ripes in late February was quite heavy.

Mature greens are produced in Dade County, the Ft. Pierce, Ft. Myers-Immokalee, Manatee-Ruskin-Wauchula (Central West Coast) and North Central areas. Fall harvest began at Ft. Pierce, and Ft. Myers-Immokalee in early November, with peak fall shipments the week of November 22. These fall areas completed general harvest by mid-December. The West Central area was light in fall production. Dade County early fall plantings were heavily lost or damaged by Hurricane Betsy. Only a light volume was obtained in late November, and continued below normal the first half of December. The January 30-31 freeze burned tops and killed some older plants.

Spring plantings were up at Ft. Pierce and Ft. Myers-Immokalee, to be seriously damaged by the January 30-31 freeze. Almost all near the Central acreage was reseeded. Spring harvest at Immokalee began in early April with volume shipments the last two weeks of the month. Peak shipments at Ft. Pierce occurred in early to mid-May.

The West Central crops were in full volume in late May. June 8 and 9 Hurricane Alma, the earliest ever recorded, ended harvest. North Central had a very poor marketing season, first because of price and secondly, because of the adverse effect of Hurricane Alma.

1/ Vine-ripes are designated. All other figures represent mature greens.

Production from Florida's 67,000-acre watermelon crop was estimated at 10,050,000 cwt., which sold for $17, 588,000 six percent less than the previous season's. The 160 cwt. average yield is a record. Prices, however, were not as favorable. The average $1.75 per cwt. was 15 percent less than the previous year's average and has been exceeded frequently.

Earliest planting and harvest was in the Immokalee-Naples portion of the south-west sector. Frost and freezing temperatures occured on January 30-31. Considerable reseeding and spot replanting was necessary. Some fields were planted in November and were well advanced. Planting at Indiantown, other than a small acreage for early winter harvest, began in December, and was active most of January. Emerged acreage had to be replanted in early February. The same was true of plantings in other south and central areas, but most were in the pre-emergence stage. Wet fields retarded planting in North and West Florida.

Harvest started at Immokalee in early April. Peak was attained in shipments the second week of May and harvest was underway in Ft. Pierce and Arcadia area, and Hardee-Manatee Counties. Shipments the second week of May increased from 651 carlots the first week of the month to 2,266. Harvest started at Oxford in North Central about May 25, and at Trenton-Chiefland June 8. Hurricane Alma brought excessive rain to a wide area but very little wind damage was reported. Harvest in North Florida had spread to the Live Oak, Madison, Jefferson County area by mid-June and the Levy-Gilchrist area was in peak harvest. Shipments from peninsula Florida were heaviest the week ended June 18, but shipments of Florida melons continued into July.

During the early part of the season, prices were greatly influenced by labor and transportation problems. Economic abandonment was high and confined primarily to the southwest counties. Martin, Polk, DeSoto and Sumter also had rather heavy abandonment.

Available transportation is a very important factor in marketing melons. Of the 23,194 equivalent carlots shipped, 68 percent were reported as truck movement, 20 percent by "piggy-back" or rail-truck and the balance in conventional rail cars.

A number of varieties were marketed. Charleston Gray was the leading variety, but Garrison type, Garrisonian and Jubilee increased, and Crimson Sweet was important. Small acreages of other varities were harvested.

1/ Panama okra imports include less than carlot quantity from Costa Rica and Guatemala.

NOTE: There were no imports that moved through Florida via rail in the 1965-66 Crop Year. Some 13,075 pounds of avocados from the Dominican Republic were reported for the week ending October 30, 1965, arriving at Florida ports. Ecuador imports into Florida accounted for 5,395 pounds during a four-week period in May 1966 for avocados.
