ACKNOWLEDGMENT

The acreage, production and value statistics in this bulletin are official state and USDA estimates prepared by the Florida Crop and Livestock Reporting Service. The county and area detail were made possible by the participation of the Department of Food and Resource Economics, University of Florida, in the estimating program. The Bureau of State Markets, Florida Department of Agriculture, and the County Extension Agents, University of Florida, Cooperative Extension Service, were also very helpful in supplying area and county information. Shipment statistics were provided by the Market News sections of the Florida Department of Agriculture and the USDA Agricultural Marketing Service.

Grower organizations have provided valuable assistance and data throughout the season. These groups include the Florida Celery Committee, Florida Tomato Committee, Florida Sweet Corn Exchange, South Florida Vegetable Exchange, Zellwood Sweet Corn Exchange, and North Florida Growers Exchange. Sales agencies and transportation firms provided the inputs necessary to complete the statistical story.

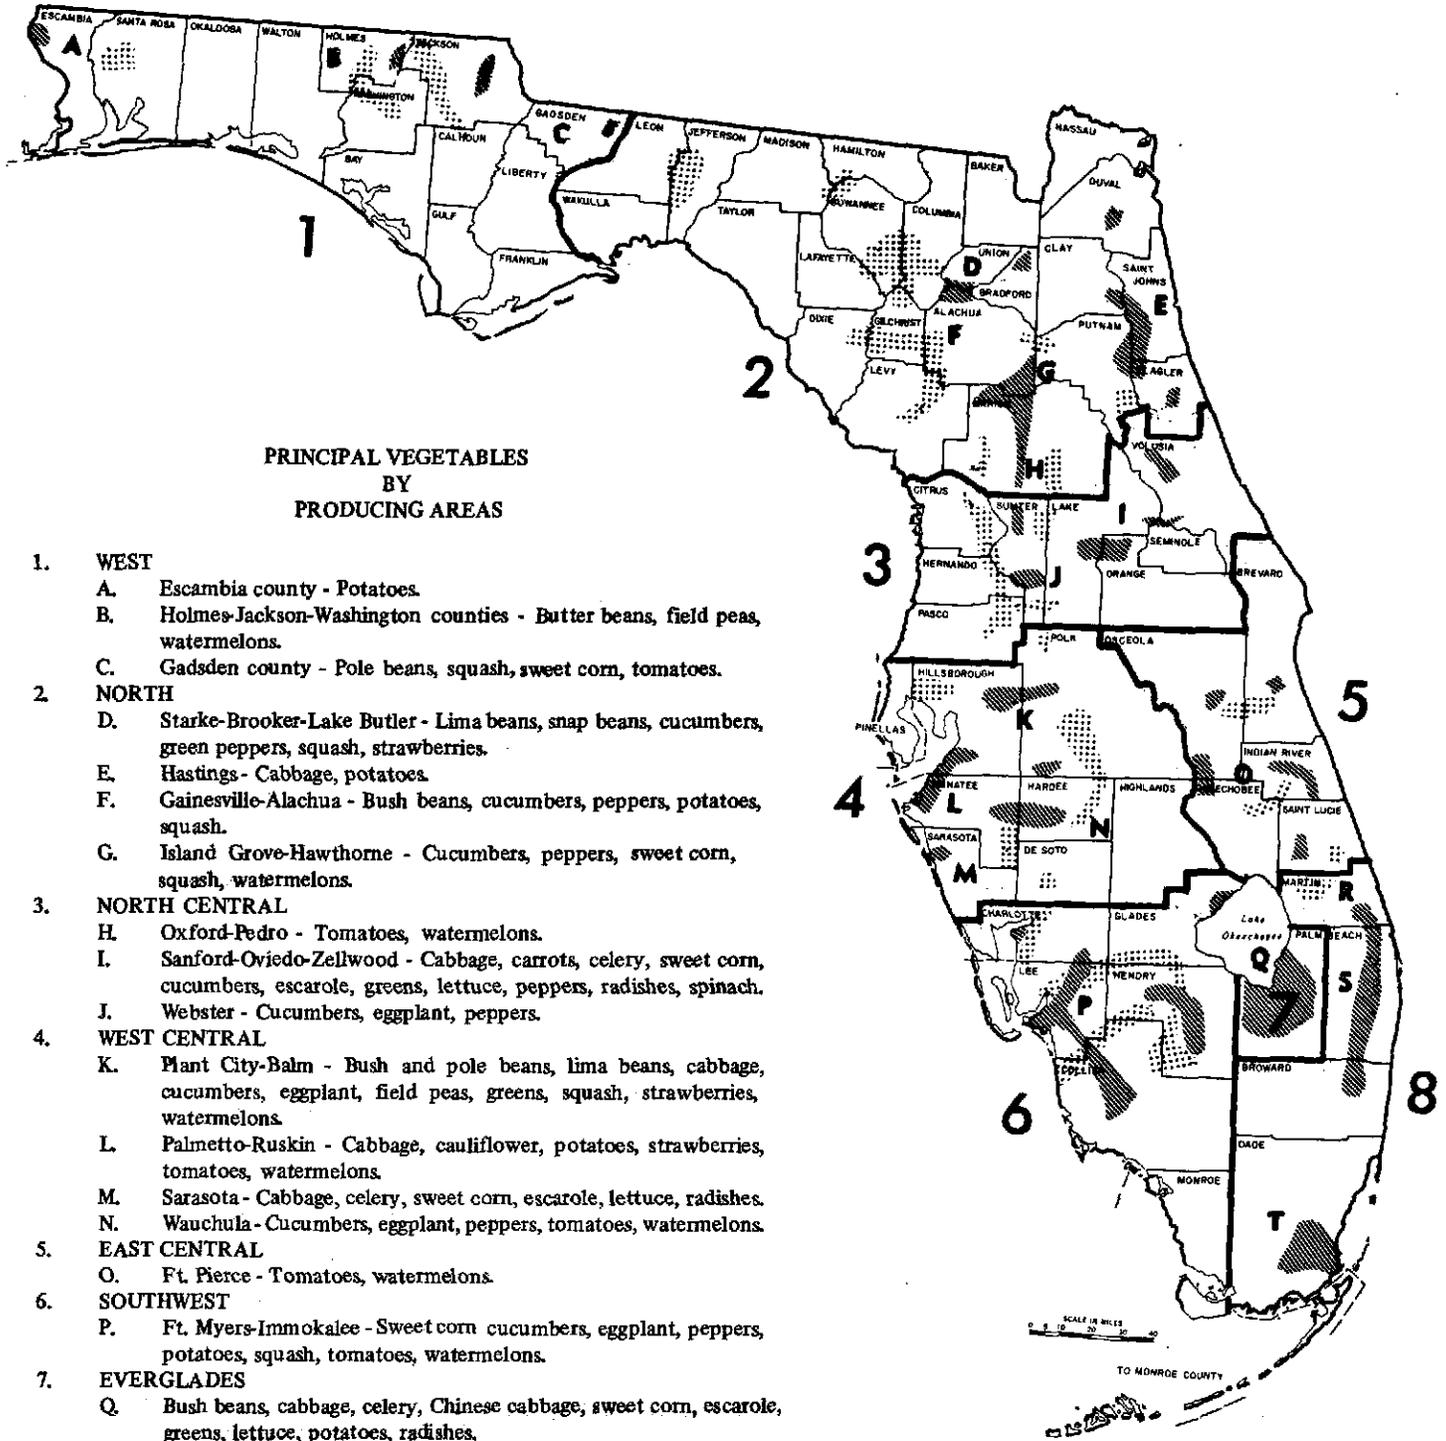

Foremost, the growers, shippers and processors volunteered most of the basic data used in developing these official statistics. The public spirited cooperation of these individuals and groups is appreciated.

Fieldmen James Spires, Immokalee; Charles Robertson, Homestead; Wallace Jacobs, North Palm Beach; and Larry Amlong of Palmetto collected much of the basic acreage, production and price statistics in this bulletin. This report was assembled under the direction of Ed C. James, Gerald H. Moody and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service and E. F. Scarborough, Bureau of Market News. The authors also wish to thank Becky Altman, Jackie Bowen, Ray Crickenberger, Joe Galant, Laura Grimsley, Kitty Hildreth, Janet Meyer, Barbara Palmer, Mable Robinson, Tommy Scherer, Pat Todd, Angeline van Loon and others of the Florida Crop and Livestock Reporting Service who assisted in compiling and preparing this report.

PRINCIPAL VEGETABLES
BY
PRODUCING AREAS

1. WEST
 - A. Escambia county - Potatoes.
 - B. Holmes-Jackson-Washington counties - Butter beans, field peas, watermelons.
 - C. Gadsden county - Pole beans, squash, sweet corn, tomatoes.
2. NORTH
 - D. Starke-Brooker-Lake Butler - Lima beans, snap beans, cucumbers, green peppers, squash, strawberries.
 - E. Hastings - Cabbage, potatoes.
 - F. Gainesville-Alachua - Bush beans, cucumbers, peppers, potatoes, squash.
 - G. Island Grove-Hawthorne - Cucumbers, peppers, sweet corn, squash, watermelons.
3. NORTH CENTRAL
 - H. Oxford-Pedro - Tomatoes, watermelons.
 - I. Sanford-Oviedo-Zellwood - Cabbage, carrots, celery, sweet corn, cucumbers, escarole, greens, lettuce, peppers, radishes, spinach.
 - J. Webster - Cucumbers, eggplant, peppers.
4. WEST CENTRAL
 - K. Mant City-Balm - Bush and pole beans, lima beans, cabbage, cucumbers, eggplant, field peas, greens, squash, strawberries, watermelons.
 - L. Palmetto-Ruskin - Cabbage, cauliflower, potatoes, strawberries, tomatoes, watermelons.
 - M. Sarasota - Cabbage, celery, sweet corn, escarole, lettuce, radishes.
 - N. Wauchula - Cucumbers, eggplant, peppers, tomatoes, watermelons.
5. EAST CENTRAL
 - O. Ft. Pierce - Tomatoes, watermelons.
6. SOUTHWEST
 - P. Ft. Myers-Immokalee - Sweet corn cucumbers, eggplant, peppers, potatoes, squash, tomatoes, watermelons.
7. EVERGLADES
 - Q. Bush beans, cabbage, celery, Chinese cabbage, sweet corn, escarole, greens, lettuce, potatoes, radishes.
8. SOUTHEAST
 - R. Martin county - Cabbage, potatoes, tomatoes, watermelons.
 - S. Pompano - Bush beans, lima beans, sweet corn, cucumbers, eggplant, peppers, squash, tomatoes.
 - T. Homestead - Bush and pole beans, cabbage, sweet corn, cucumbers, potatoes, squash, strawberries, tomatoes.

DEFINITIONS AND EXPLANATIONS

QUARTERLY GROUPS—During the growing season, estimates were prepared for most crops on a calendar quarter basis in order to indicate available supplies for shorter periods of time than the entire crop year. The fall, winter and spring quarterly estimates are combined into a crop year total for all crops. Production sold or utilized is shown by months.

PLANTED ACREAGE is the total acreage which has been planted for harvest during one designated quarter. Acreage lost and replanted to the same crop in time for harvest in the same quarter, is counted only once. Acreage harvested and planted again to the same crop is counted twice.

HARVESTED ACREAGE is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

YIELD is the average production per acre of merchantable quality harvested and sold or utilized.

PRODUCTION is the quantity actually harvested and sold or utilized.

UNIT VALUE for fresh market sales is the equivalent price received, f.o.b. shipping point basis and encompasses all grades and sizes marketed or utilized. Included are packing charges, selling charges, precooling, top ice, or other costs which contribute to the value of the product at shipping point. The value per unit for quantities sold to processors is the average value paid for usable quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

TOTAL VALUE is the equivalent value of production sold or utilized based on the unit value. Cullage and other quantities not sold or utilized because of natural or economic factors are excluded.

OTHER COUNTIES include harvested acreage for all counties for which either published data would result in the disclosure of individual operations or acreage totals for specific commodities are of minor importance in the state.

All shipments and unloads, rail, truck, air and boat, are recorded nationally in 10,000 pound units each day. Annual releases are in 1,000 cwt. In this publication, shipments and unloads for some commodities were converted to most common trading units. Rail and piggyback weights and conversion factors were determined by several Market News Service field offices. Mixed car (rail) loadings by stations have been prorated by commodities.

Where possible, the national Market News Service in Washington, D. C. has established a single uniform weight per commodity to be used nationally in converting to weight units for the various means of transportation. Weights per common container used and number of units per rail car or truck may be obtained by writing the MNS office in Winter Park, Florida.

PRODUCTION AND PRICE UNIT—The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to what is believed to be the most commonly used containers. If changes in container weights are necessary, all data pertaining to the production of the commodity in question is revised to maintain comparability between years. The table below gives the net weight used per container and the number of containers per hundredweight.

PRODUCTION AND PRICE UNIT
Most common unit estimated net weight, number of units per hundredweight, principal vegetable commodities, Florida, 1979-80 crop season

Commodity	Unit	Est. net weight	No. of units per cwt.	Commodity	Unit	Est. net weight	No. of units per cwt.
		Pounds				Pounds

Lettuce	Cwt.	100	---				

SUMMARY OF THE 1979-80 VEGETABLE SEASON

The farm value of Florida grown vegetables, melons, potatoes and strawberries sold in the 1979-80 crop year totaled \$788.7 million, up \$34.7 million from the 1978-79 crop year. Acreage harvested was slightly below the previous year. Crops showing the greatest gains in harvested acres were snap beans for fresh market, celery, lettuce, tomatoes, "other vegetables" and strawberries. Crops increasing in value were snap beans, sweet corn, cucumbers, eggplant, green peppers, radishes, squash, tomatoes, "other vegetables," watermelons, potatoes and strawberries. Crops with lower values than the previous year were cabbage, celery, escarole and lettuce. Most of the declines were due to lower season average prices. Tomatoes, which rose \$24.0 million, showed the greatest increase in value followed by watermelons which increased \$14.3 million, "other vegetables," \$8.2 million, and cucumbers \$8.0 million from a year ago. Cabbage and lettuce showed the greatest declines, down \$30.0 million and \$11.3 million, respectively, from the previous year.

Average yields for eggplant, squash, tomatoes, watermelons and strawberries increased during the year but yields declined for snap beans, cabbage, celery, sweet corn, cucumbers, escarole, lettuce, green peppers, radishes and potatoes.

Season average prices of snap beans, sweet corn, cucumbers, eggplant, green peppers, radishes, squash, "other vegetables," watermelons, potatoes and strawberries were higher than a year ago. Season average prices for cabbage, celery, escarole, lettuce and tomatoes were below a year ago.

Land preparation, planting and transplanting were very active in most areas of the state during July. Growing conditions were generally good to excellent over most of the farming areas in August. Planting activity progressed favorably. Rains resulting from hurricanes, cool fronts and a tropical storm slowed plantings in September. High winds damaged crops but little acreage was lost when Hurricane David moved up the east coast in early September. Planting and harvesting activities were interrupted by showers in October and November as numerous cold fronts moved across the state.

Temperatures were generally mild during most of December. Heavy rains in early December washed beds and leached fertilizer. Cold fronts in early and late December brought low temperatures in the 30's as far south as central Florida. Damage was limited. Foliage of some tender vegetables received light frostburn in the central areas and light windburn in the southern sections.

Much of January was characterized by numerous cold fronts with scattered frosts. Rainfall was mostly light

and low temperatures were in the 30's and 40's during the first half of January. Temperatures were generally mild and rainfall heavier during the remainder of the month. Heavy showers and thunderstorms with up to 5 inches of rain occurred in late January. Accompanying strong winds caused minor damage to some tender crops.

Cold weather with near freezing low temperatures dominated the first part of February. Many areas established record lows in early February as cold arctic air invaded the state. Brisk winds damaged some tender foliage. A warming trend ended when a late month cold front brought freezing temperatures and frosts to central Florida.

A severe cold front in early March brought freezing temperatures over the entire Peninsula with record lows across the state. Freezing temperatures and gusty winds resulted in lost acreage and plant damage, particularly for tender crops. The remainder of March was generally mild with scattered showers and thunderstorms.

Temperatures were above normal in early April and near normal for the remainder of the month. Skies were frequently cloudy with numerous scattered showers and thunderstorms. Rainfall was generally light to moderate. Some damaging hail occurred in many areas on April 19 when a weak front moved over the state. Harvest was in full swing for some crops while others were declining seasonally.

The month of May was characterized by cloudy skies and numerous showers and thunderstorms in the central and southern vegetable growing areas. Heavy rains and very strong winds during late May caused some light to moderate plant damage in areas of southeast Florida. Daytime high temperatures were mostly in the upper 80's with nighttime lows in the 50's and 60's. Harvest was very active for some vegetables but declining for others.

Hot days and warm nights dominated the weather picture during June in the vegetable growing areas. Rainfall was light in early June. A cold front that stalled over central Florida, June 9-12, brought rains to most areas of the state. Rainfall was heaviest in the southeast with over 9 inches at Homestead. Showers and thunderstorms during the remainder of June brought moisture to most areas, but rainfall was light in the southwest. Harvest was essentially complete for most crops in the major vegetable areas by the end of June.

Most of the weather data for this summary was supplied through the National Weather Service, U.S. Department of Commerce, Ruskin, Florida. Information on the effects of weather on crops was provided by the Florida Crop and Livestock Reporting Service fieldmen.

SNAP BEANS 1979-80

Florida growers produced 5.1 million bushels of bush and pole beans during the 1979-80 season for fresh and processing utilization, down 19 percent from last year. Acreage harvested for fresh and processing totaled 54,300 acres, up slightly from the 54,100 acres harvested during the previous season. The average yield for the 1979-80 season was 89 bushels per acre for fresh market and 129 bushels per acre for processing, as compared with 102 bushels and 163 bushels per acre, respectively, the previous year.

The average f.o.b. price of \$8.11 per bushel for fresh market was 53 cents more than the previous year and a record high. At \$2.97 per bushel, snap beans for processing are up 75 cents from last season and 49 cents above the 1977-78 season price of \$2.48. Total value, at \$36.7 million, was 1 percent above last year.

Bush beans are grown in all areas of Florida with the exception of the east central and southwest areas. The southeast continues to be the major producing area. Pole beans are produced primarily in Dade County, with small acreages grown in Gadsden and Marion counties and the west central area.

Earliest fall supplies of snap beans originate from west Florida. The north and west central areas, the Everglades and southeastern districts also provide fall production. The southeast is the sole source of supply during the winter. The other areas resume production in the spring.

Snap bean production extended from early October into mid June. The fall crop peaked in December. Marketings declined in January and February. Production began to increase in March, and the spring crop peaked in April. Eighteen percent of the marketings occurred in April, down 3 points from April the previous year.

Variable weather influenced last year's bean crop. Hurricane David caused extensive windburn damage but very little acreage was lost. Heavy late September to late October rains in the southeast washed beds and leached fertilizer which reduced stands in newly planted fields. During the winter season, brisk, cold winds whipped plants, causing leaf damage and fruit scarring. Cold weather slowed maturity, resulting in lower volume. Weather during the spring season was generally favorable. Quality was mostly good but yields were below normal for the spring season.

CABBAGE 1979-80

Florida's cabbage growers produced 7.2 million crates and sacks during the 1979-80 season, down 15 percent from the previous season. The gross value was \$21.9 million, less than half the gross value of \$51.9 million received in the 1978-79 season. The average f.o.b. price was \$3.05 per crate or sack, down sharply from the \$6.17 received for the prior season's crop.

Total acres planted amounted to 18,600 acres, up nearly 2 percent from the 1978-79 season. Acreage harvested totaled 15,800, a decline of 11 percent from a year ago. Abandonment was higher than usual because of low prices. Yields were also down from last season, averaging 454 crates per acre, 18 crates less than a year ago.

Cabbage was available for market beginning in late November and continuing through June. Production was below normal during the fall period and the lowest since the 1969-70 season. The peak month was March, followed by April while February was close behind at third.

The Hastings area, which includes the 3 counties of Flagler, Putnam and St. Johns, continued to lead the state in production, accounting for nearly 56 percent of the state's total. St. Johns County led all other counties in acreage harvested with 28 percent of the total acres harvested in the state.

Direct seeding and transplanting was beginning in late August and early September although less acreage was planted during that period than usual. The most active month for transplanting was November followed by December. Seeded acreage was the most active during October, however, only a small portion of the total acreage planted is seeded direct in fields.

First cuttings began at the end of November. Harvest increased slowly at first, then picked up during February and March. Winter production accounted for 60 percent of the total crop, the highest for that period since the 1974-75 season. Spring production was down from the previous spring and the spring of 1978.

CARROTS 1979-80

Production of carrots in Florida continued to increase during the year. There were 1,223,000 cwt. shipped out of Florida for both fresh and processing during the 1979-80 crop year. Fresh use constituted 76 percent and processing 24 percent. This compares with 74 percent fresh and 26 percent processing the previous year. Approximately 12 percent of the fresh carrots were mini or finger carrots compared with 14 percent the previous year. The remaining 88 percent were regular type carrots. Carrots are not part of the regular statistical program in Florida, therefore, data on acreage and production are not published separately. However, data are included in "Other Vegetables."

The muck soils around Lake Apopka, near Zellwood and the Everglades provide a good medium for growth. By far the majority of carrots are grown in the Zellwood area. The mini or finger carrot movement usually begins in late October and is complete by the end of May. Regular size carrots are harvested from November through June. The peak harvest period last season was mid January to early May. The young carrots are subject to cold damage in January and February in the Zellwood area. Growing conditions were generally favorable. Size and quality were good throughout most of the season.

CELERY 1979-80

Florida celery marketings of 8.2 million crates were harvested from 12,200 acres during the 1979-80 growing season. The average yield of 673 crates per acre compares with 695 crates the previous year.

Prices averaged lower than the previous year and at \$5.70 f.o.b. per crate, compared with \$6.78 per crate during the 1978-79 season. Prices during each quarter averaged below a year earlier. The sharpest decline occurred in the winter and spring quarters. The crop was valued at \$46.8 million, a decline of 15 percent from the previous crop year.

The Everglades, with 86 percent of the harvested acreage, was the foremost area of production throughout the season. The north central area, supplemented by a light supply from the Sarasota area, accounted for the remaining 12 percent of acreage and provided a continuous supply throughout the season.

Plant bed preparation and seeding were underway by mid June. Transplantings were gaining momentum by late August and became quite active in September. Transplantings in the Everglades were winding down for the season in early April and were complete by mid April. Plantings were also complete in the north central area by early May. Growers in the Sarasota area normally plant from October to March.

Light harvest began in early November in the Zellwood area and the second week of November in the Everglades area. Growing conditions were hot and humid in the summer and early fall months. Heavy rains slowed progress in November. Cool weather in December was beneficial for growth and development. Quality was fair to good early in the season and then improved from good to very good as the season progressed. Yields and size were fair to good but generally below year earlier levels.

No significant damage occurred from cold fronts moving into vegetable growing areas. The late winter and spring markets were on the weak side. Prices averaged considerably below year earlier levels. Approximately 4 percent of the crop was not harvested for various reasons. Growers passed some acreage in order to maintain good quality celery.

Celery production was most active December through May with April being the peak month. Cutting was completed in all areas by the first week of July.

Celery is subject to a federal marketing order administered by the Florida Celery Committee. Field supervisors provided the basic acreage and production data. In cooperation with the committee, these data are assembled into weekly, monthly and annual reports and published in this annual report.

CHINESE CABBAGE 1979-80

Chinese cabbage is grown primarily on the mucklands of Zellwood and the Everglades areas. The organic soils provide a very good medium for rapid growth. Harvest was underway by late November. Volume was light through December but increased to good supplies by January and February. Production reached a peak in February and March. Good volume was available from December to mid

May. During April, Zellwood was providing good supplies while the Everglades was declining seasonally. The season was over by June 1. Quality was mostly good throughout the season. No significant cold damage occurred. Shipments for the season totaled 135,000 cwt., down 17 percent from the previous year.

SWEET CORN 1979-80

Florida, the Nation's leading sweet corn producer for fresh sales, marketed 11.2 million crates during the 1979-80 season. Production declined 8 percent from the previous year. The decline was due to both a reduction in acreage harvested and lower yields per acre. Growers harvested 51,800 acres, down 5 percent from the 54,500 acres harvested during the 1978-79 season. Yields averaged 215 crates per acre statewide compared with 222 crates per acre a year earlier. Yields have averaged above 200 crates per acre for every year since the record 244 crate average in the 1972-73 crop year.

The season average f.o.b. price of \$5.03 per crate was 78 cents above the average for the previous year. The total value of the crop was \$56.1 million, up \$4.7 million from the \$51.4 million received for the 1978-79 crop. The value of sweet corn ranked second in the state in vegetable crops and was exceeded only by the value of tomatoes.

First plantings of the season were underway in the Everglades in July. Seeding on the east coast got underway in late September. First harvest began in the Everglades in late September. Cutting continued to gain and reached a

good level by November. The declining harvest in the Everglades during December was partially offset by supplies from the lower east coast and Dade County.

Harvest of the spring crop in the Everglades was underway by mid April. The Everglades became the main source of supply in late April as the east coast and Dade areas began to decline seasonally. The transition of harvest from the Everglades to Zellwood occurred in mid to late May. Lake County provided a good supply into July. The season was complete by mid July.

A small acreage provided supplemental supplies at Zellwood and the west central area during the early fall, and at Sarasota in the early spring.

Weather during most of the growing season was generally favorable, with the exception of freezing temperatures on March 3. Some acreage was lost in the Zellwood and Everglades areas. Quality and ear size improved as the season progressed and averaged mostly good for the season. The spring crop grew rapidly under favorable conditions.

CUCUMBERS 1979-80

Florida production of cucumbers for fresh market and processing utilization during the 1979-80 crop year was 5.1 million bushels, down 3 percent from the 1978-79 crop. The fresh market channel utilized 79 percent of the production and the remaining 21 percent was for processing. The 23,100 acres planted was down 200 acres from the previous year. Harvested acres totaled 21,700, down 300 acres from a year earlier. Average yield per acre for fresh market, at 280 bushels, was up 12 bushels from the previous season. Cucumbers for processing averaged 145 bushels per acre, as compared with 164 bushels last year. Total production was valued at \$45.7 million compared with \$37.6 million for the previous year. The f.o.b. price for 1979-80 averaged \$8.67 per bushel for fresh market and \$10.01 per bushel for processing, as compared with \$7.61 and \$5.42 per bushel, respectively, the previous year.

Supplies in 1979-80 were generally available from October through June, with light marketings January through March. Many of the recorded shipments moving out-of-state

January through March are from offshore and truck imports resold in mixed loads.

The production of cucumbers is well distributed across the state. The southwest area, with 38 percent of the acreage in 1979-80, is the largest area. The west central area accounted for 33 percent of the planted acreage in the state. The west, north, north central and southeast areas provide the remaining acreage.

Weather during much of the growing season was favorable. The crop was in mostly good condition during the fall, but some young plants were damaged by rains in late September. Strong, cold winds, starting in December, slowed growth and caused leafburn damage. Freezes in February were followed by a severe freeze in early March. Damage was heavy to young plantings and the remaining fall acreage. Considerable replanting was necessary. The crop was in generally good condition during the spring despite adverse weather with hail damage to the crop in April. Fruit quality, color, size and yields were mostly good for the spring season.

EGGPLANT 1979-80

Plantings totaled 3,100 acres, the same as the 1978-79 season. Yields averaged 600 bushels per acre, 15 bushels above the previous season. Weather was generally favorable during much of the fall and spring. No acreage was lost but some spot resetting was necessary after Hurricane David. During the late fall and winter, strong winds scarred fruit and burned tender leaves. Poor market conditions caused some abandonment of older fields in November. However, harvest was resumed in some of these fields when market conditions improved during January. In early March, freezing temperatures caused foliage damage and some loss of bloom and small fruit. Crop condition was mostly good to very good in the spring after plants recovered from the March freeze. Quality, size, and yields were mostly good.

Production of eggplant increased to 1.7 million bushels, 2 percent above last year's production. Total sales increased to \$7.3 million compared with \$6.8 million a year earlier. The increase was due to higher yield per acre and price per bushel because harvested acres were unchanged from 1978-79. The season average price of \$4.36 per bushel is 22 cents higher than a year ago. Compared with prices a year earlier, the fall crop was higher, the winter crop was unchanged, and the spring crop was lower.

The distribution of marketings was generally normal. Harvest began in late September, reached a peak in November, and dropped during the winter. November volume is low compared to the past 2 years because poor market conditions resulted in abandonment of some acreage. Harvest began to increase in April and reached a peak in June. Harvest was virtually complete in July. The southeast area around Pompano accounted for 45.7 percent of the harvested acreage. The northern and central areas combined contributed 46.4 percent of acreage harvested with the remaining small acreage in the southwest.

Production is generally continuous through the entire crop year in the southeast and southwest, while the crops in the western, northern, and central areas are for fall and spring harvest only. Those areas receive too much freezing weather to grow eggplant during the winter months.

First sales were from cuttings in the western and northern growing areas in late September. Harvest followed the usual pattern and progressed southward in the fall, continued through the winter in southern areas and then moved back northward in the spring.

ESCAROLE-ENDIVE 1979-80

Production of escarole and endive during the 1979-80 season totaled 3.0 million crates, down 10 percent from a year earlier. The 6,300 acres harvested were down 200 acres from the previous season. Yield per acre averaged 481 crates compared with 515 crates the previous year.

Prices during the season averaged \$3.72 per crate, compared with \$4.05 a year earlier. The total value of sales, at \$11.3 million, was 17 percent below the previous year.

The Everglades, which had 75 percent of the harvested acreage in the 1979-80 season, began seeding in early September. Weekly planting schedules continued through March. Light harvest began in late October and supplies were continuous through May. The mucklands around

Zellwood provided good volume in the late spring months. The small acreage grown around Lake Placid and Sarasota mucklands furnished supplemental supplies during much of the season.

Sales started slow in late October but increased to a good volume by November. Marketings reached peak levels in the February to April period. Harvest was completed in May.

Growing conditions were generally favorable during most of the season. However, rains during October interrupted planting and harvest activity. Some light cold damage to outer leaves occurred in early March. Quality of escarole and endive was mostly good throughout the season.

LETTUCE 1979-80

Florida lettuce growers produced a record 2.7 million cwt. during the 1979-80 season. An 8 percent increase in harvested acreage more than offset the slight decline in yield. The average yield of 193 cwt. per acre compares with 199 cwt. for the previous year. The season average f.o.b. price of \$13.67 per cwt. was \$5.08 below the favorable price of a year earlier. Prices were lower than the previous year for all quarters with the greatest difference in the winter quarter. Prices during the spring quarter were only slightly below the previous spring.

Acreage, production and value statistics of lettuce in this bulletin combine the various types into a single estimate. The types in order of importance include iceberg, 62 percent; romaine, 18 percent; Boston, 9 percent; bibb and leaf combined, 11 percent of the total acreage harvested.

The Everglades muckland accounted for 88 percent of planted acreage and was the source of a continuous supply of good quality lettuce which began in early November and ended in late May. Outside the Everglades, Zellwood is the other major producing area, with Sarasota and the Lake Placid mucklands contributing light supplies during most of the season.

Seeding was underway in early September. All areas were actively planting by early October. The Everglades and Sarasota areas had continuous plantings through March.

Very light harvest of specialty types was underway by late October and continued light until mid November. Volume gained considerably in December with growers cutting in most areas. The Everglades continued to provide the bulk of the volume during the winter period. Virtually all of the iceberg type is grown in the Everglades. Supplies peaked in April and declined to the season's end by late May. Volume from the Zellwood area was light during the winter months. Moderate supplies are available from this area during the fall and spring seasons.

Growing conditions in the early fall were hot and humid. Heavy rains slowed field work. Growth was generally rapid. Several cold fronts slowed growth and maturity during the winter months but overall damage was light. Heavy volume was available statewide in March and April. Quality was generally good throughout the season.

PEPPERS 1979-80

Florida produced 7.2 million bushels of peppers during the 1979-80 season, a decline of 11 percent from the previous year. The average yield of 414 bushels per acre was 7 percent below the 445 bushels per acre last season. Production was from 4 percent fewer harvested acres.

The season average f.o.b. price of \$7.13 per bushel was up from an average of \$6.13 for the previous year. The total value of \$51.0 million was 3 percent above the previous year. Prices were generally good during the fall and winter periods. Marketings were light in October but increased to a fair level by December. Supplies decreased during the winter months but began an upward swing in April. The peak spring production occurred in May. The season then declined and was mostly over by the end of June.

The 6 percent decrease in total planted acreage was the result of a 16 percent drop in the heavy producing southwest area. Increases in the north central and west central areas were not enough to offset the decrease. The southwest accounted for 48 percent of the state's total pepper acreage. The southeast had 22 percent; the north central area, 13 percent; the west central area, 9 percent; and the north, 8 percent.

During September, hot weather and dampoff, plus wind damage in the Pompano area necessitated considerable replanting to improve stands. Conditions during the remainder of the fall season were generally good. Strong, cold winds during the winter months caused foliage burn to young crops. Replanting was active after the early March freeze. Spring weather conditions were generally favorable. Yields were fair to good.

POTATOES 1979-80

Production of potatoes in 1980, including both winter and spring seasons, totaled 5.3 million cwt., down 12 percent from the previous year. A total of 29,600 acres were planted, a decline of 4 percent from the 30,700 acres planted during the 1978-79 season. Of the total acreage planted, 27,300 acres were harvested, slightly over 2 percent below the year before. The value of the crop was estimated at \$36 million, nearly 19 percent above the 1979 crop. The increase in value was attributed to a higher average price received for all crops with winter potatoes up sharply.

The average yield was 194 cwt. per acre, 21 cwt. below last year. The spring yields at 194 cwt. were down from last year's record of 228 cwt. In the Hastings area, which covers the three counties of Flagler, Putnam and St. Johns, the average yield was 195 cwt., down 35 cwt. per acre from the 1979 record yield of 230 cwt. Spring potatoes grown in all other locations of the state, ranging from the Ft. Myers area in the south to northern Escambia County in the Panhandle, averaged 170 cwt. per acre. The winter crop averaged 195 cwt. per acre.

The 1980 season average price for all potatoes, at \$6.80 per cwt., was \$1.74 more than the 1979 season. All areas received higher prices than a year ago.

Both "white" and "red" skin varieties are grown over the state. The red skin types are the dominant variety grown for winter harvest in south Florida. The bulk of the winter crop is sold for table stock but a few are sold to the potato chip industry. In the Hastings area the "white skinned" varieties are the most important. A large percentage of the crop is used in the potato chip industry. Both "whites" and "reds" are grown in the Hastings area and are sold for table stock.

The winter potato harvest was late in getting underway in 1980. Harvest got underway in late January with only one percent harvested in the month. Harvest was slow during the early months causing the season to extend into the spring months. The peak shipping month was April. Harvest of the spring crop in the Hastings area got underway during late April. Peak harvest was in May but was also very heavy during June. Abandonment in the area was slightly higher than usual due partly to a hard freeze during the early morning of March 3, 1980. In the other growing areas, digging started in April and extended into early July. There was some acreage abandoned because of the freeze in early March.

RADISHES 1979-80

In 1979-80, radish plantings amounted to 32,600 acres compared with 33,600 acres planted the previous year. Acres harvested totaled 28,400, 4 percent below the record high of 29,600 in 1978-79. Yields per acre averaged 247 cartons compared with 273 cartons the previous season. The crop was valued at \$23.1 million, up \$5.5 million from a year earlier. The average f.o.b. price was \$3.30 per carton, up \$1.12 from the previous year.

A good supply of both red and white radishes was available from Zellwood, Lake Placid, and the Everglades from October through May with a light volume going into June. The fall peak harvest occurred in December. The spring peak occurred in March. Seeding of the 1979-80 crop was underway in the Everglades and north central areas in early September. Plantings were slowed by early fall rains. Light harvest was underway in early October and became quite active in mid November. Supplemental supplies were available from Lake Placid and Sarasota during the year.

SPINACH FOR PROCESSING 1979-80

Spinach statistics have not been published separately for Florida in recent years in order to avoid disclosure of individual operations. However, data for these seasons have been included in the "Other Vegetables" series shown in this publication. Data for 1973 and earlier are available

upon request. Yields per harvested acre averaged near yields a year earlier. Most of the crop is grown in the north central area. Freezing temperatures in early March caused a few problems.

SQUASH 1979-80

Florida's production of squash during 1979-80 season, at 2.4 million bushels, was .5 million bushels above last year. Harvested acreage totaled 13,500 acres, an increase of 1 percent from the previous year. The yield, at 174 bushels per acre, was up 35 bushels from the previous year.

The average f.o.b. price of \$9.30 per bushel was up \$1.79 from last season. Total f.o.b. cash receipts amounted to nearly \$22 million. Prices were generally favorable throughout the season.

Florida produces acorn, butternut, yellow crookneck, yellow straightneck, white, and zucchini squash. Dade County, with almost 27 percent of the state's harvested acreage in 1979-80, produces yellow crookneck almost exclusively. The Pompano area, in addition to being a major producing area, is also an important market for squash grown in other areas of the state. This is especially true when local supplies reach low levels during the winter

months. The southwest area produces a continuous supply of most types. Central, north, and west Florida provide a good volume of most types during the fall and spring seasons.

Squash is one of the few crops grown in Florida that is shipped every month of the year, although shipments during the summer are usually light and confined mostly to local markets. The 1979-80 season got off to a slow start. Marketings increased rapidly to a fall peak in December before showing a seasonal decline during the winter months. In mid September and early October, heavy rains delayed plantings and reduced quality, yields, and packout. During the winter months, January through March, cold temperatures and strong winds slowed growth, caused extensive foliage burn, and plant kill to both old and young crops. The weather was generally favorable during the spring quarter. Some fields were abandoned in May due to poor market conditions. Peak marketings for the season occurred in April.

STRAWBERRIES 1979-80

Florida strawberry growers produced 4.0 million flats of berries during the 1979-80 season, up 24 percent from the previous year. Harvested acreage totaling 2,500 acres increased 4 percent from the previous year. Average yield of 1,583 flats per acre increased from 1,333 flats a year earlier. The f.o.b. return per flat for the season was \$7.06, up 14 cents from the previous season. The value of the crop was a record \$27.9 million, up \$5.8 million from the \$22.2 million received a year earlier.

Laying of plastic and other field work was in full swing by late September in the important Plant City-Ruskin area. Transplantings were very active around mid October and were completed by mid November. Some replanting continued throughout November. Some scattered blooms on early plantings occurred in early December and light harvest

was underway by mid December in the Plant City and Dade areas. Early harvested berries were primarily for local use and roadside stands. Picking increased and shipments got underway in January. Peak movement occurred in March. Most of the commercial harvest was completed by late April. U-Pic harvest continued active during May. Plant growth was good. Freezing temperatures in early March caused some bloom loss. For the most part, plants and fruit were protected by sprinklers. Plant recovery from the cold was very good. Yields, fruit size and quality were generally good. Warm weather in late March and early April hastened maturity. First harvest was underway in Bradford County in late March. The season was nearing completion by early May. Yields were below normal as a result of early March freeze damage.

TOMATOES 1979-80

The total value of the Florida tomato crop for fresh and processing utilization was \$244.2 million, an 11 percent increase over the previous year. The value of the crop was a new record for tomatoes. The average price received for fresh tomatoes was \$6.28 for a 30-pound carton, 29 cents less than a year ago; however, acreage and yield were above the previous season and accounted for the record value.

Total production of 39.8 million 30-pound carton equivalents was 14 percent above last season. The fresh market channel utilized 97 percent of the total, and the remaining 3 percent was used for processing which is a secondary utilization from the fresh market acreage. The Palmetto-Ruskin area accounted for 39.7 percent of the total fresh production; the southwest 31.4 percent; Dade County 18.3 percent and the Ft. Pierce-Pompano area 7.5 percent. The remaining 3.1 percent was produced in the west, north and north central areas.

The average yield for the state was 918 (30-pound) cartons per acre, up 101 cartons from the year before. The demand was good during the year with winter production heavier than usual. Dade County produces most of the winter tomatoes. The fall shipments peaked in December, which accounted for 15.2 percent of the total production. January was the peak month during the winter season with 12.8 percent of the year's total and the spring production peaked in May accounting for 24.2 percent of the total. Tomatoes are harvested from October to early July.

The Palmetto-Ruskin area continued to be the acreage leader with 14,000 acres harvested. The southwest area ranked second, harvesting 11,800 acres, and Dade County third, harvesting 11,400 acres. The Ft. Pierce-Pompano area had 3,500 acres harvested and the north central, north and western areas harvested the balance of 1,500 acres. The largest portion of this acreage was harvested in Gadsden County.

Tomato planting got underway in July in all areas except Dade County. Growers in Dade County began planting in mid to late August. Heavy rains and strong winds from Hurricane David in early September caused some damage. Loss was generally less than 10 percent and consisted mostly of plastic blown from beds. Weather was generally favorable throughout the remainder of the fall season. During the early winter period, strong, cold winds caused some leafburn and bloom drop. Below normal temperatures prevailed during February but damage was relatively light. On the morning of March 3rd, frost and freezing temperatures caused some damage to plants and fruit. The cold was of short duration and recovery was very good. There was damage in several areas from scattered hail during April. Damage was limited to a few fields. Harvest was complete in the south by the end of May but continued active into July in the Palmetto-Ruskin area, Gadsden County and other central and northern areas.

WATERMELONS 1979-80

Watermelon acreage planted during the 1979-80 season totaled 45,000 acres -- 10 percent less than the 1978-79 growing period. Of the total acres planted 42,000 acres were picked at least one time. This was 1 percent less than a year ago. The crop of nearly 7.9 million cwt. was 22 percent above the 1978-79 season. The average yields varied by areas, ranging from 140 cwt. in the Panhandle to 215 cwt. in the south. The state average was 185 cwt. tying the previous record of 185 cwt. set during the 1974-75 season.

The average price received was a record 5.92 cents per pound, nearly 1 cent above a year ago. Prices received by growers for their melons were the highest in the south where they averaged over 7 cents per pound. The value of the crop was a record \$46.5 million, \$11.4 million over the previous record set in the 1974-75 season.

The watermelon harvest usually begins in the Immokalee area in April but for the fourth consecutive season, harvest was late getting started because of cold weather during the late winter or early spring. However, there is a very small acreage grown in the fall in the south and harvested

during November through early January, depending on weather conditions. This small acreage is included in the total for the spring season. The harvest season progresses northward into the central areas during May, the northern areas in June, and comes to an end in the Panhandle by mid to late July. June continues to be the heaviest shipping month.

First plantings were made in the Immokalee area during late December. Cold weather during early March damaged the crop in the south and killed most of the young plants in the west central areas requiring extensive replanting and spot replanting. Fields that were set back by the cold made good recovery.

Harvest was heavy in central and northern areas during June. By late June dry weather was hurting the crop in the north and Panhandle. The dry conditions were a major factor in the heavy abandonment in the Panhandle. Demand continued good into July. The season was complete by the end of July.

OTHER CROPS 1979-80

Cantaloups are grown in Florida primarily in the southwest and north central areas. Much of the production is sold through roadside stands and local markets. The peak harvest period is normally May and June. Harvest begins in the southwest and progresses northward seasonally. There are some cantaloups grown during the fall months in the southwest and west central areas. Acreage continues at a relatively low level. However, this crop is not part of the regular statistical program for vegetables and melons. Researchers continue to work toward developing new varieties that will be better adapted to Florida's soils and climate. There appears to be some promise that acreage may expand in the future.

Cauliflower continues to expand in the Zellwood, Hillsborough-Manatee and Everglades areas. Supplies are available from December through April. At the present time statistics are not available for publication. However, if this crop continues to grow, it may become part of the regular statistical program in the future. Shipment information is being recorded by the Market News Service. In the 1979-80 season there were 86 thousand cwt. shipped out-of-state, compared with only 65 thousand cwt. shipped out the previous season. This converts to 391 thousand 22-pound cartons.

Sub-tropical vegetable production increased from the previous year due primarily to improved yields. Improved fertilization, spray programs and better growing weather contributed to the good yields. Acreage harvested was up only slightly from the previous year. By far the majority of the acreage is grown in Dade County. Commercial production began in the early 60's. Sub-tropical vegetables is a colloquial expression applied to certain vegetables eaten primarily by those of Latin American and Caribbean origin. The most common name for each crop followed by the scientific name is listed below. Other common terms for the various vegetables are shown in parenthesis. The crops consist primarily of boniatos-ipomea batatos (sweet potato); calabaza-cucurbita (pumpkin); malanga-xanthosoma sagittae-folium (dasheen, yautias); and yuca-monihot esculenta (sweet cassava). The boniato, calabaza and malanga constitute the bulk of the production. The Dade County Agricultural Extension Service reported 10,600 acres of sub-tropical vegetables planted in the 1979 calendar year. Peak production of the malanga occurs in February through April. Efforts are now underway to even out the supply throughout the year. Available crop land continues to be a limiting factor for all agricultural production in Dade County. New varieties of calabazas are being brought in from Colombia, South America to select those which do best in south Florida. Cassavas (yuca) show a lot of potential as a

producer of ethanol to use in gasahol as well as a fresh market vegetable. Flaking and freezing processes are being researched for boniato, cassava and malanga. Miami is an important point of consumption for the Florida production. Also, considerable amounts are consumed in the Tampa Bay area. The supplies shipped out of the state are primarily for the New York City and Philadelphia areas.

Collard, turnip, mustard and other greens are grown throughout the state and centered around the large population areas and in the muck soils of the Everglades and Zellwood areas. Good volume is available November through March. Shipments totaled 112 thousand cwt. during the 1979-80 season, down from the 141 thousand cwt. for the previous season.

Okra is grown in many areas of the state during the warm season of the year. However, Dade County produces okra for local use as well as for shipments to other states. Peak production takes place in May and June with a good supply in October and November.

Green onions and leeks are produced in the north central areas. Supplies are marketed primarily for local use at roadside stands and markets. There are several large producers who ship to other states. Supplies of dry onions are limited. Most of the dry onions are produced in southern and west central areas of the state.

Parsley is available in both the curly and plain types. The bulk of the commercial volume shipped to other states is produced in the Everglades and Zellwood areas. Light supplies sold for local use are available from the Sarasota, Lake Placid and other areas.

Southern peas are grown primarily in the northwest, west central and Everglades areas of Florida. Dade County also produces a considerable amount of *southern peas*. Light supplies are available September through December. Heavy movement occurs in May and June, especially in northwest Florida. A high percentage of the crop is utilized for processing. Good supplies are sold through local markets for fresh use. Market News Service shipment statistics for out-of-state market, show 21 thousand cwt. for fresh market during the 1979-80 season.

Watercress is available the year round. The major source of supply is the Oviedo area. Most of the production is shipped to northern and eastern markets in the United States. A limited supply is available from local state farmers markets, especially the Sanford Market.

NOTE: Pompano interstate shipments of Mexican produce imported through Arizona and Texas border points, 1979-80 crop year. 1,000 package units: Cucumbers, bushel, 39; okra, crate, 4; tomatoes, cherry, flat, 2. This data has not been previously reported in the above tables. There was an additional amount of West Mexico produce brought into Florida for sale within the state, especially tomatoes for Jacksonville, Plant City and Tampa repackers.
