ACKNOWLEDGMENT

The acreage, production and value statistics in this bulletin are official state and USDA estimates prepared by the Florida Crop and Livestock Reporting Service. The county and area detail were made possible by the participation of the Department of Food and Resource Economics, University of Florida, in the estimating program. The Bureau of State Markets, Florida Department of Agriculture, and the County Extension Agents, University of Florida, Cooperative Extension Service, were also very helpful in supplying area and county information. Shipment statistics were provided by the Market News sections of the Florida Department of Agriculture and the USDA Agricultural Marketing Service.

Grower organizations have provided valuable assistance and data throughout the season. These groups include the Florida Celery Committee, Florida Tomato Committee, Florida Sweet Corn Exchange, South Florida Vegetable Exchange, Zellwood Sweet Corn Exchange, and North Florida Growers Exchange. Sales agencies and transportation firms provided the inputs necessary to complete the statistical story.

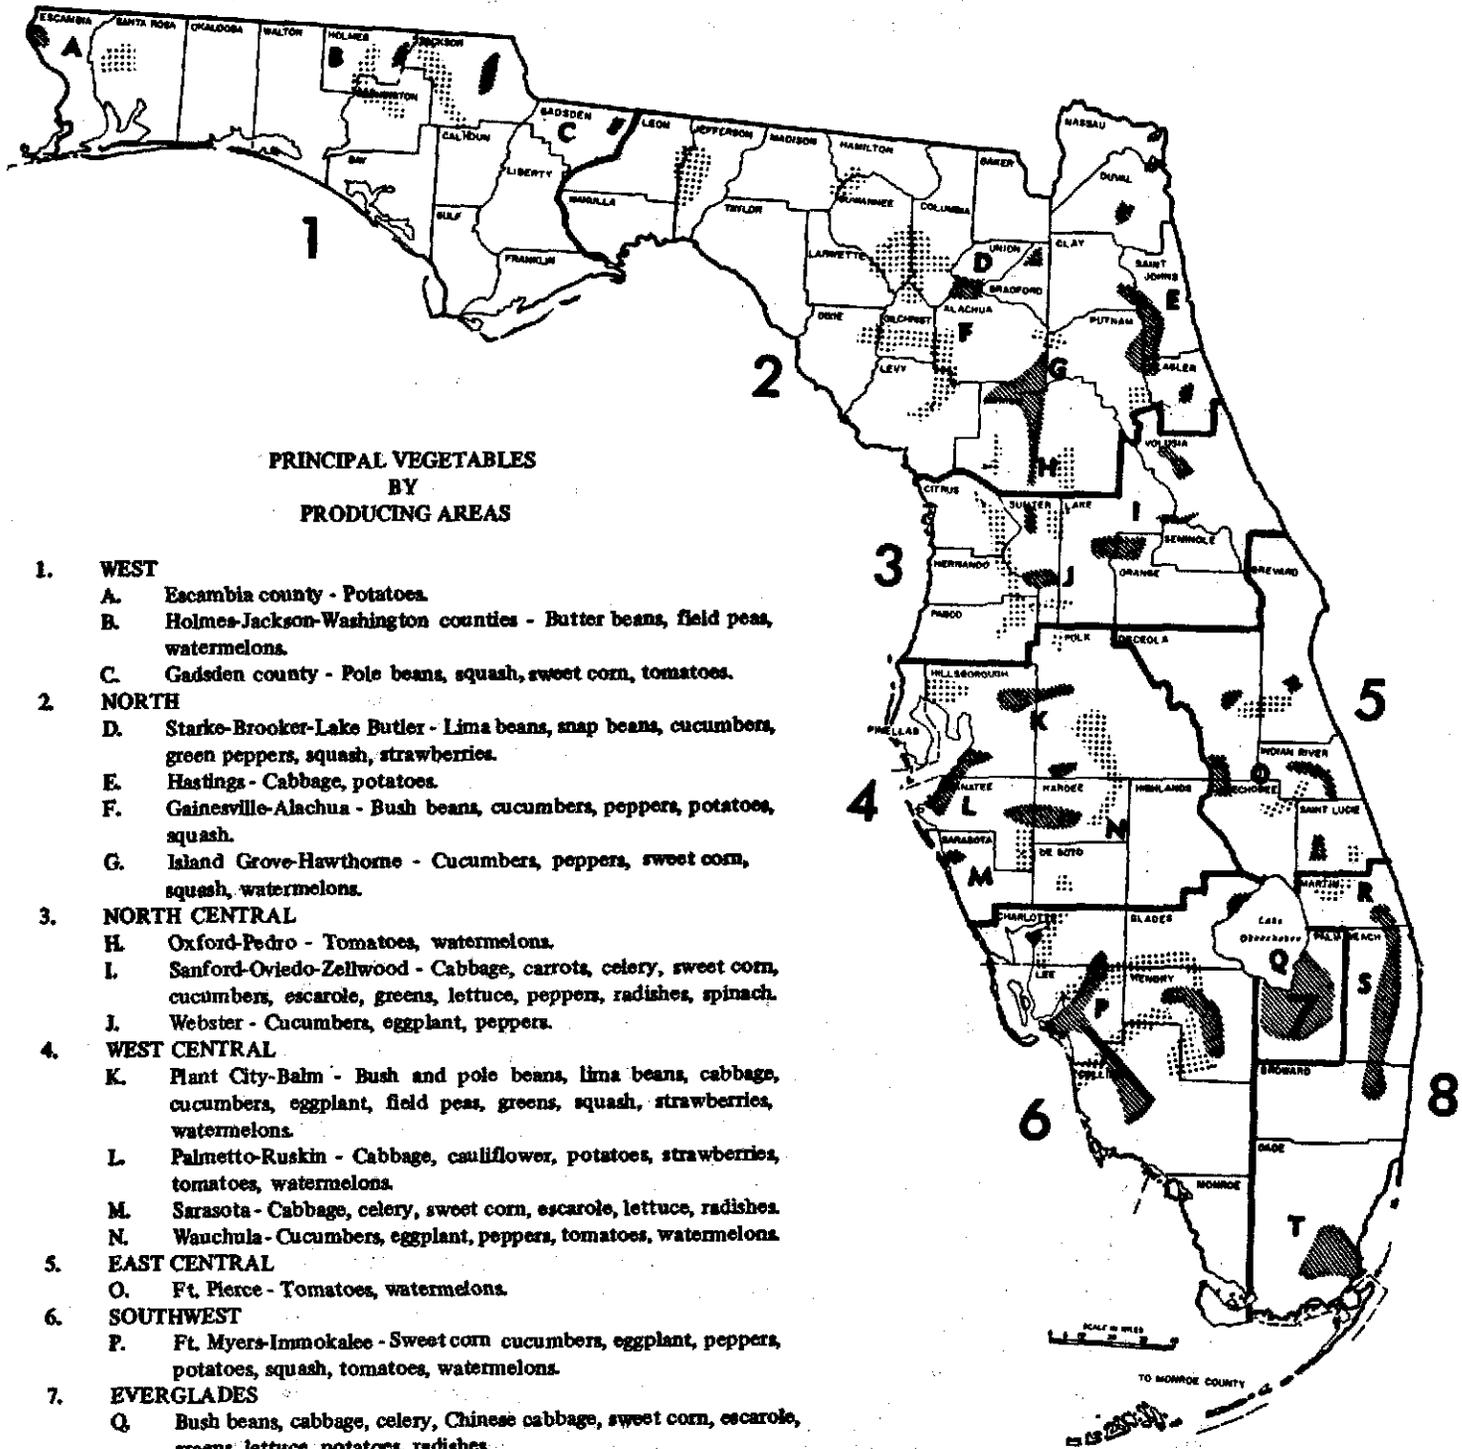

Foremost, the growers, shippers and processors volunteered most of the basic data used in developing these official statistics. The public spirited cooperation of these individuals and groups is appreciated.

Fieldmen James Spires, Immokalee; Charles Robertson, Homestead; Wallace Jacobs, North Palm Beach; and Larry Amlong of Palmetto collected much of the basic acreage, production and price statistics in this bulletin. This report was assembled under the direction of Ed C. James, Gerald H. Moody and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service and E. F. Scarborough, Bureau of Market News. The authors also wish to thank Becky Altman, Jackie Bowen, Marilyn Clark, Diana Clingan, Ray Crickenberger, Linda Fisher, Joe Galant, Kitty Hildreth, Barbara Palmer, Tommy Scherer, Pat Todd and others of the Florida Crop and Livestock Reporting Service who assisted in compiling and preparing this report.

**PRINCIPAL VEGETABLES
BY
PRODUCING AREAS**

1. **WEST**
 - A. Escambia county - Potatoes.
 - B. Holmes-Jackson-Washington counties - Butter beans, field peas, watermelons.
 - C. Gadsden county - Pole beans, squash, sweet corn, tomatoes.
2. **NORTH**
 - D. Starke-Brooker-Lake Butler - Lima beans, snap beans, cucumbers, green peppers, squash, strawberries.
 - E. Hastings - Cabbage, potatoes.
 - F. Gainesville-Alachua - Bush beans, cucumbers, peppers, potatoes, squash.
 - G. Island Grove-Hawthorne - Cucumbers, peppers, sweet corn, squash, watermelons.
3. **NORTH CENTRAL**
 - H. Oxford-Pedro - Tomatoes, watermelons.
 - I. Sanford-Oviedo-Zellwood - Cabbage, carrots, celery, sweet corn, cucumbers, escarole, greens, lettuce, peppers, radishes, spinach.
 - J. Webster - Cucumbers, eggplant, peppers.
4. **WEST CENTRAL**
 - K. Plant City-Balm - Bush and pole beans, lima beans, cabbage, cucumbers, eggplant, field peas, greens, squash, strawberries, watermelons.
 - L. Palmetto-Ruskin - Cabbage, cauliflower, potatoes, strawberries, tomatoes, watermelons.
 - M. Sarasota - Cabbage, celery, sweet corn, escarole, lettuce, radishes.
 - N. Wauchula - Cucumbers, eggplant, peppers, tomatoes, watermelons.
5. **EAST CENTRAL**
 - O. Ft. Pierce - Tomatoes, watermelons.
6. **SOUTHWEST**
 - P. Ft. Myers-Immokalee - Sweet corn cucumbers, eggplant, peppers, potatoes, squash, tomatoes, watermelons.
7. **EVERGLADES**
 - Q. Bush beans, cabbage, celery, Chinese cabbage, sweet corn, escarole, greens, lettuce, potatoes, radishes.
8. **SOUTHEAST**
 - R. Martin county - Cabbage, potatoes, tomatoes, watermelons.
 - S. Pompano - Bush beans, lima beans, sweet corn, cucumbers, eggplant, peppers, squash, tomatoes.
 - T. Homestead - Bush and pole beans, cabbage, sweet corn, cucumbers, potatoes, squash, strawberries, tomatoes.

DEFINITIONS AND EXPLANATIONS

SEASONAL GROUPS--During the growing season, estimates were prepared for most crops on a six month seasonal group basis. The periods are for the crop year July-December and January through June. The two six month periods were combined in this publication into a crop year total for all crops. Production sold or utilized is shown by months.

PLANTED ACREAGE is the total acreage which has been planted for harvest during the crop year. Acreage lost and replanted to the same crop in time for harvest in the same quarter is counted only once. Acreage harvested and planted again to the same crop is counted twice.

HARVESTED ACREAGE is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

YIELD is the average production per acre of merchantable quality harvested and sold or utilized.

PRODUCTION is the quantity actually harvested and sold or utilized.

UNIT VALUE for fresh market sales is the equivalent price received, f.o.b. shipping point basis and encompasses all grades and sizes marketed or utilized. Included are packing charges, selling charges, precooling, top ice, or other costs which contribute to the value of the product at shipping point. The value per unit for quantities sold to processors is the average value paid for usable quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

TOTAL VALUE is the equivalent value of production sold or utilized based on the unit value. Cullage and other quantities not sold or utilized because of natural or economic factors are excluded.

OTHER COUNTIES include harvested acreage for all counties for which either published data would result in the disclosure of individual operations or acreage totals for specific commodities are of minor importance in the state.

All shipments and unloads, rail, truck, air and boat, are recorded nationally in 10,000 pound units each day. Annual releases are in 1,000 cwt. In this publication, shipments and unloads for some commodities were converted to most common trading units. Rail and piggyback weights and conversion factors were determined by several Market News Service field offices. Mixed car (rail) loadings by stations have been prorated by commodities.

Where possible, the national Market News Service in Washington, D. C. has established a single uniform weight per commodity to be used nationally in converting to weight units for the various means of transportation. Weights per common container used and number of units per rail car or truck may be obtained by writing the MNS office in Winter Park, Florida.

PRODUCTION AND PRICE UNIT--The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to what is believed to be the most commonly used containers. If changes in container weights are necessary, all data pertaining to the production of the commodity in question is revised to maintain comparability between years. The table below gives the net weight used per container and the number of containers per hundredweight.

PRODUCTION AND PRICE UNIT
Most common unit, estimated net weight, number of units per hundredweight, principal vegetable commodities, Florida, 1980-81 crop season

Commodity	Unit	Est. net weight	No. of units per cwt.	Commodity	Unit	Est. Net weight	No. of units per cwt.
		Pounds				Pounds	
Snap Beans	Bushel	30	3.333	Lettuce	Cwt.	100	---

Escarole	Crate	25	4.000	Watermelons	Cwt.	100	---

SUMMARY OF THE 1981-82 VEGETABLE SEASON

The farm value of Florida grown vegetables, melons, potatoes and strawberries sold in the 1981-82 crop year totaled \$927.4 million, up \$64.6 million from the 1980-81 crop year. Acreage harvested was 3 percent below the previous year. Crops showing the greatest declines in harvested acres were cabbage, sweet corn, lettuce, radishes and tomatoes. Crops with the largest gains in harvested acres were snap beans, squash and strawberries. Crops increasing in value were snap beans, cabbage, sweet corn, eggplant, escarole, lettuce, radishes, squash, tomatoes, watermelons and strawberries. Crops with lower total values than the previous year were carrots, celery, cucumbers, green peppers and potatoes. Except for strawberries, most of the increases in value were due to higher season average prices. Strawberries, which rose \$24.5 million as a result of gains in production and prices showed the greatest increase in value. Next was lettuce which increased \$20.8 million, tomatoes, \$9.7 million, and sweet corn, \$6.9 million from a year ago. Potatoes and green peppers showed the greatest declines, down \$12.6 million and \$8.9 million, respectively, from the previous year.

Average yields for cucumbers, eggplant, escarole, potatoes, squash and tomatoes increased over the previous year but yields declined for snap beans, cabbage, carrots, celery, sweet corn, lettuce, green peppers, radishes and strawberries.

Season average prices for cabbage, carrots, celery, sweet corn, eggplant, escarole, lettuce, radishes, watermelons and strawberries were higher than a year ago. Prices for snap beans, cucumbers, green peppers, potatoes, and tomatoes were lower than the previous year. Squash prices were unchanged.

Land preparation was active in most areas of the state during July but generally hot, dry weather limited plantings. Growing conditions in August were mostly good except for heavy rains late in the month. Plantings were on schedule except in Dade County where tropical storm Dennis caused heavy flooding. Rainfall was variable in September and October with heavier amounts along the lower East Coast. Irrigation became steady in the drier localities during October. Wet and windy weather in early November interrupted harvesting and planting, particularly in the lower East Coast area.

Weather in December was adverse as a series of cold fronts moved over the state. On December 11, freezing temperatures and frost extended southward to Lake Okeechobee. Record breaking low temperatures occurred on the 19th and 20th when an arctic air mass with frigid strong winds invaded the state. Temperatures dipped to near 20 degrees in spots of south Florida. Damage to some tender crops was heavy in the Immokalee-Everglades area. The remainder of December was mostly mild.

Cold fronts were numerous in January but the only severe freeze occurred on the 12th. Temperatures fell into the 20's in the vegetable areas. Some acreage was lost and damage was moderate to heavy, particularly to older plants. A brief warming trend with rain was followed by another cold front with light to moderate frost after mid month. Mild to cool temperatures with scattered showers prevailed for the rest of the month.

February was generally mild with mostly normal to above normal temperatures in the winter vegetable areas. Rainfall was variable except for some general rains about midmonth. Irrigation was very active in the drier localities.

Temperatures in March were mostly above normal with periods of unseasonably warm weather. Statewide rains of significant amounts with reports of large hail in central Florida occurred in early March. Midmonth was fair and dry. A cold front that stalled over south Florida in late March brought 2 to 4 inches of rain to most areas. Flooding occurred in Palm Beach County which had up to 10 inches of rain.

Early April was a period of showers, locally severe thunderstorms and strong winds. Plant damage was variable. Some serious flooding occurred in the north central area. Hail and high winds caused heavy damage in the Sanford area. Mid April was mostly hot and dry. More rain fell in late April with heaviest amounts along the lower East Coast. Harvest was in full swing for some crops while others were declining seasonally.

Much of May was fair and dry with normal to below normal temperatures. Irrigation was very active. Tropical air combined with upper air disturbances produced widespread and above normal shower and thunderstorm activity for late May. Cumulative rainfall for the year was above normal for most stations. Harvest was very active for some vegetables but declining for others.

Hot days and warm nights dominated the weather picture during June in the vegetable areas. Humid tropical air produced above normal shower and thunderstorm activity in early June. Heavier amounts fell in south Florida as Hurricane Alberto approached the coast before dissipating. The following week was mostly hot and dry. The remainder of June was wet with frequent thunderstorms and above normal rains almost statewide. Harvest was essentially complete for most crops in the major vegetable areas by the end of June.

Most of the weather data for this summary was supplied through the National Weather Service, U. S. Department of Commerce, Ruskin, Florida. Information on the effects of weather on crops was provided by the Florida Crop and Livestock Reporting Service fieldmen.

SNAP BEANS 1981-82

Florida growers produced 4.0 million bushels of bush and pole beans during the 1981-82 season for fresh and processing utilization, up 9 percent from a year earlier. Acreage harvested for fresh and processing totaled 48,300 acres, up 13 percent from the 42,600 acres harvested during the previous season. The freeze in January resulted in some lost acreage. The average yield for the 1981-82 season was 82 bushels per acre for fresh market and 100 bushels per acre for processing, as compared with 85 bushels and 133 bushels, respectively, for the previous year.

The average f.o.b. price of \$10.33 per bushel for fresh market was 6 cents less than the previous year. Prices were high in January and February because supplies were reduced by the January freeze. At \$3.00 per bushel, snap beans for processing were down 45 cents from last season. Total value, at \$39.7 million, was 8 percent above last year.

Bush beans are grown in all areas of Florida with the exception of the east central and southwest areas. The southeast continues to be the major producing area. Pole beans are grown primarily in Dade County, with small acreages in Gadsden and Marion counties and the west central area.

Earliest fall supplies of snap beans originate from west Florida. The northern and west central areas, the Everglades and southeastern districts also provide fall production. The southeast is the sole source of supply during the winter. The other areas resume production in the spring.

Snap bean production extended from late September into mid June. The fall crop peaked in December. Marketings declined in January and February but less than last year. Production for the season peaked in March. Normally, April is the month of peak production. About 19 percent of the fresh marketings occurred in March.

Variable weather influenced the bean crop. Locally heavy rains in the fall delayed plantings or necessitated re-seeding in some areas. Cold weather in December slowed growth. The January freeze resulted in variable plant damage and some lost acreage. The remainder of the winter was generally mild. Heavy rains during March and April hurt the crop in the Pompano area. Hail damage and disease problems also contributed to lower production. Spring weather was generally favorable. Quality was mostly good but yields were variable.

CABBAGE 1981-82

Florida growers produced 5.8 million crates and bags of cabbage during the 1981-82 season. Production at this level is 20 percent less than the previous year and the lowest since the 1969-70 season when 5.5 million crates were produced. The gross value was \$33.6 million, a 24 percent increase over the previous year's total of \$27.1 million. The average f.o.b. price was \$5.75 per crate or bag, up \$2.02 from the \$3.73 received for the prior season's crop. The higher average price received accounted for the sharp increase in value.

Total plantings were 16,500 acres, down 6 percent from the 17,600 planted during the 1980-81 season. A total of 14,200 acres were harvested. The average yield of 411 crates or bags per acre was down by 48 bags from the previous season's average.

Cabbage was available for market in late October and continued through June. Production during the fall months was down from the previous fall. The peak month was April followed by March and January.

The Hastings area, which includes the three counties of Flagler, Putnam and St. Johns, is the leading producing area in the state. This area accounted for 65 percent of the state's production during the 1981-82 season. The leading cabbage producing County is St. Johns with 4,700 acres harvested, or 33 percent of the state's total.

Planting got underway in late August and early September. The most active period was October through December. Transplanting is the main method of planting cabbage. Some seed is planted directly into fields but this method accounts for a very small portion of the total acreage planted.

Harvest began in late October, increasing slowly into December and then picked up sharply in January. A hard freeze near mid January damaged the cabbage crop and production dropped off sharply in February. Harvest increased in March and peaked during April. Winter production accounted for nearly 52 percent of the total production, the spring months accounted for 39 percent and fall months 9 percent.

CARROTS 1981-82

Production of carrots in Florida for fresh market and processing utilization during the 1981-82 season totaled 921,000 cwt., down 33 percent from the previous season. Fresh use constituted 80 percent and processing 20 percent. This compares with 78 percent fresh and 22 percent processing the previous year. Approximately 21 percent of the fresh carrots were mini or finger carrots compared with 16 percent a year earlier. The remaining 79 percent were the regular type carrots.

There were 9,400 acres harvested from the 10,500 acres planted during the 1981-82 crop year. This compares with 10,500 acres harvested from 11,000 acres planted a year earlier. The severe freeze of January 1982 resulted in some lost acreage, particularly of young carrots, and plant damage. Effects of the freeze, some disease problems, and heavy

gradeout at times lowered yield and production. Average price received for the 1981-82 crop was \$14.30 per cwt. compared with \$12.30 per cwt. the previous year. Total value was \$13.2 million, down 22 percent from the record \$16.8 million for the 1980-81 crop.

The muck soils around Lake Apopka, near Zellwood, and in the Everglades area south of Lake Okeechobee provide a good medium for growth. By far the majority of carrots are grown in the Zellwood area. The mini or finger carrot movement usually begins in late October or early November and ends by late May. Regular size carrots are harvested from November through June. Young carrots are subject to cold damage during January and February in the Zellwood area. Size and quality were mostly good during the 1981-82 crop year.

CELERY 1981-82

Florida celery marketings of 5.1 million crates were harvested from 9,500 acres during the 1981-82 growing season. The average yield of 537 crates per acre compares with 605 crates the previous year.

Prices averaged slightly higher than the previous year and at \$7.58 per crate, compared with \$7.09 per crate during the 1980-81 crop season. Prices during February, March and April averaged higher than the same months the previous year while prices during November through January and May and June averaged lower than the previous year.

The Everglades, with 83 percent of the harvested acreage in the state, was the foremost area of production throughout the season. The north central area supplemented by a light supply from the Sarasota area, accounted for the remaining 17 percent of acreage and provided continuous supplies during the season.

Plant bed preparation and seeding were underway by mid June. Transplanting got underway in August and became active in September. Wet soils in August and early September delayed harvest. Transplantings for the season in the Everglades ended in early April. Transplantings in the central area ended in May. Growers in the Sarasota area normally planted from October to March.

Light harvest began in the central area in early November, and at mid November in the Everglades. Freezing

temperatures on January 12 caused some problems in celery and some seeders developed later. After the January freeze, growing conditions were generally favorable. Spraying for leaf miners was active in the fall and spring. Celery quality was generally good to excellent during most of the winter and spring harvest periods. A limited amount of acres were passed during the spring. Overall yields were about 11 percent below a year earlier and were well below recent years. The heavy drop in yields occurred in the Everglades since yields were higher in the central area. Some of the reduced yields resulted from the January freeze and development of seeders. Prices were generally favorable during the midwinter months but low in April and May. Approximately 7 percent of the crop was not harvested for various reasons. This compares with 9 percent not harvested the previous year. Some acreage was passed in order to maintain good quality celery.

Celery cutting was most active December through May with peak production coming during April and May. Cutting was completed in all areas by mid July.

Celery is subject to a federal marketing order administered by the Florida Celery Committee. Field supervisors provided the basic acreage and production data. In cooperation with the Celery Committee, these data are assembled into weekly, monthly and annual reports and published in this Annual Summary.

CHINESE CABBAGE 1981-82

Chinese cabbage is grown primarily on the mucklands of the Zellwood and Everglades areas. The organic soils provide a very good medium for rapid growth. Harvest was underway by late November and reached a good volume in December. Volume declined in January because of the severe freeze and then steadily increased until it peaked in April.

Good supplies were available into May. During April and May, Zellwood was providing good supplies while the Everglades were winding down for the season. Light supplies were available into June. Quality was generally good during most of the growing season. Shipments for the 1981-82 season totaled 100,000 cwt. compared with 137,000 cwt. a year earlier.

SWEET CORN 1981-82

Florida continued as the Nation's leader in sweet corn production for fresh market. During the 1981-82 marketing year, Florida produced 10.8 million crates of corn. This is 4 percent less than production a year earlier. The decline was due primarily to fewer acres. Part of the reduced harvested acreage was due to the severe freeze on January 12, 1982 that destroyed considerable acreage of older corn near the harvest stage in the Pompano area. Harvested acres totaled 50,100 compared with 51,900 harvested the previous year. Yields averaged 215 crates per acre, down two crates from the previous crop year.

The season average f.o.b. price of \$5.68 per crate was 86 cents more than the \$4.82 per crate average in the 1980-81 crop season. Sweet corn ranked second in value of vegetables produced in the state and was exceeded in value only by tomatoes.

First plantings of the season were underway in the Everglades and Zellwood areas in July. Seeding along the southeast coast got underway in early October. First harvest began in the Zellwood area after mid September. The crop in the Everglades was slowed by heavy rains. Harvest got underway by mid October. Harvest ended in December when freezing temperatures entered the area on December 20.

Some acreage was lost. Harvest then shifted to the East Coast and later Dade County. Pulling of commercial acreage in Dade County started around February 1 and reached good volume by late March. The mid January freeze damaged the Pompano crop and harvest was light for several weeks. Early spring planted fields in the Everglades were damaged and some replanting was necessary.

Harvest of the important spring crop got underway in early April in the Everglades area and provided the main supply until the Zellwood area came into production in late April and early May. The Zellwood area was the main source of supply during June and July. The season ended around mid July.

A small acreage continued to provide supplemental supplies from Zellwood and the west central area during the early fall and from Sarasota in the early spring.

Weather during the growing season was marked by heavy rains in the fall and freezes during December and January. Yields were reduced somewhat by the adverse conditions. Growing conditions after the January freeze were generally favorable. Quality and ear size improved as the season progressed into late winter and early spring.

CUCUMBERS 1981-82

Florida's production of cucumbers for fresh market during the 1981-82 crop year was 4.7 million bushels, up about 16 percent from the 1980-81 crop. The 16,100 acres planted for fresh market was up 300 acres from the previous year. Fresh market harvested acres totaled 15,300, an increase of 400 acres from a year earlier. Average yield per acre for fresh market, at 308 bushels, was up 35 bushels from the previous season. Total fresh market production was valued at \$33.0 million compared with \$36.1 million for the 1980-81 season. The fresh market price for 1981-82 averaged \$7.00 per bushel compared with \$8.85 the previous year.

Supplies in 1981-82 were generally available from October through June, with light marketings during the winter months and June. Many of the recorded shipments moving out-of-state January through March are from off-shore and truck imports resold in mixed loads.

The production of cucumbers is well distributed across the state. The southwest area, with 43 percent of the planted acreage in 1981-82, is the largest area. The west central area accounted for 30 percent of the acreage in the state. The west, north, north central, and the southeast areas provide the remaining acreage.

The crop was mostly in good condition during the fall. Record breaking cold temperatures December 19-20 essentially destroyed the crop in the Immokalee area and caused damage in other areas. A hard freeze on January 12 killed new plants above ground in the Immokalee area and caused heavy damage in other areas. Planting and replanting were very active. Remaining winter weather was generally mild and volume rebounded in March. Spring was warmer than normal; and irrigation was very active during the dry periods. Fruit quality, color, and size were mostly good during the spring season but yields were variable.

EGGPLANT 1981-82

Plantings totaled 2,640 acres, down 15 percent from the 1980-81 season. Yields averaged 657 bushels per acre compared with 592 bushels for the previous season. Weather was generally favorable during much of the fall, and crop progress was good. Strong winds in late October and November whipped plants and scarred fruit. Freezes in December caused heavy bloom loss but little plant damage. A hard freeze in January resulted in moderate to severe plant damage but only light acreage loss. Generally mild weather in February was favorable for plant recovery but production was light because of earlier bloom damage. Crop condition was generally good to very good during the spring season. Fruit quality, color, size, and yields were mostly good.

Production of eggplant, at 1,661,000 bushels, was slightly above last year's production. Total sales increased to \$9.6 million compared with \$9.4 million a year earlier. The increase was due to a higher price per bushel because higher yields offset lower harvested acres so that production was about unchanged compared with 1980-81. The season average price of \$5.76 per bushel is 9 cents higher than a year ago. Compared with a year earlier, prices for most months were higher in the fall and spring but lower in the winter.

The distribution of marketings was generally normal. Harvest began in late September, reached a peak in November, and dropped during the winter, particularly in February. Harvest increased rapidly in March and reached a peak in May. Peak harvest was a month earlier than usual because generally mild weather after the January freeze and above normal temperatures during the spring resulted in an early maturing crop. Harvest was essentially complete in early July. The southeastern area around Pompano accounted for 52 percent of the harvested acreage. The northern and central areas combined contributed about 38 percent of the acreage harvested with the remaining acreage in the southwest.

Production is generally continuous throughout the entire crop year in the southeast and southwest. The crops in the western, northern, and central areas are for fall and spring harvest only because these areas receive too much freezing weather to grow eggplant during the winter months.

First sales were from cuttings in the western and northern areas in late September. Harvest followed the usual pattern and progressed southward in the fall, continued through the winter in the southern areas, and then moved back northward in the spring.

ESCAROLE-ENDIVE 1981-82

Production of escarole and endive during the 1981-82 season totaled 2.7 million crates, down 7 percent from a year earlier. The 5,300 acres harvested were down 15 percent from the previous year. Several large growers discontinued raising escarole and quit farming completely. Yield per acre averaged 512 crates compared with 470 crates the previous year.

Prices during the season averaged \$6.65 per crate compared with \$3.91 a year earlier. Prices were higher than a year earlier in every month of marketings. Prices were very favorable during the December through February period. Total value of sales, at \$18.0 million, was 58 percent more than for the previous season and was the highest of record. The Everglades, which had 67 percent of the harvested acreage, began seeding in late August and early September. Weekly plantings continued through March. Light harvest

began in late October and early November and was continuous into early June. The mucklands around Zellwood provided good volume in the late spring months. The small acreage grown around the Lake Placid and Sarasota muck soils furnished supplemental supplies during much of the season.

Sales started slowly in late October and increased to good volume by mid November. Marketings reached peak levels in February, March and April. Sales were complete for the season by early June.

Rains slowed plantings during the fall and the January freeze slowed growth and burned outer portions of plants. Growing conditions for the remaining period were generally favorable. Quality of escarole was mostly good during the season.

LETTUCE 1981-82

Florida lettuce growers produced 2.3 million cwt. during the 1981-82 season, down 16 percent from the previous year. A 13 percent drop in acreage harvested and a slight decline in yields resulted in the decline in production. The average yield per acre was 183 cwt. compared with 188 cwt. for the previous year. Growers harvested 12,300 acres compared with 14,200 acres the previous year. The season average f.o.b. price of \$25.16 per cwt. was well above the \$13.39 per cwt. received the previous year. Total value reached a record \$56.6 million for the season. Prices averaged above a year earlier for every month of the season.

Acreage, production and value statistics of lettuce in this bulletin combine the various types into a single estimate. The types in order of importance include iceberg, romaine, Boston, bibb and leaf.

The Everglades muckland accounted for 86 percent of the planted acreage and was the source of a continuous supply of good quality lettuce which began in late October and early November and continued through May. Outside the Everglades, Zellwood is the other major producing area, with Sarasota and the Lake Placid mucksoils contributing light supplies during most of the season.

Seeding was underway in late August and early September. All areas were actively planting by mid October. The Everglades and Sarasota areas had continuous plantings through March.

Very light harvest of specialty types was underway in late October and harvest continued light until late November. Volume gained significantly in December and continued heavy until early May. Harvest of the iceberg type began in late November. Most iceberg lettuce is planted in the Everglades. Harvest was completed for all types by late May. Volume from the Zellwood area was light during the winter months. Moderate supplies are available from this area during the fall and spring months.

Growing conditions in the fall were hot, humid and wet. Frequent showers interrupted planting and slowed field work. Several cold fronts slowed growth and caused some damage to outer leaves. After the January freeze, growing conditions were mostly favorable. Heavy volume was available during March and April. Quality was generally good throughout the growing season.

PEPPERS 1981-82

Florida produced 7.9 million bushels of peppers during the 1981-82 season, slightly below the previous year. The average yield of 412 bushels per acre was 5 percent below the 435 bushels per acre last season. Harvested acreage, at 19,300 acres, was 5 percent more than the 18,300 acres harvested in 1980-81.

The season average f.o.b. price of \$7.00 per bushel was down from an average of \$8.10 for the previous season. The total value of \$55.6 million was 14 percent below the previous year. Prices were generally below last year except for May and June. Prices in February and March were well below last year because adverse weather had much less effect on production than a year ago. Peak spring production occurred in April. The season then declined and was mostly over by the end of June.

Total planted acreage increased 5 percent over the previous season. Increases in acreage for the north, west central and southeast areas were partially offset by decreases for the north central and southwest areas. The important southwest area accounted for 41.4 percent of the state's total pepper acreage. The southeast had 32.1 percent; the north area, 9.3 percent; the north central area, 8.8 percent; and the west central area, 8.4 percent.

Hot weather and damp-off necessitated spot replanting to improve stands during November. Conditions during the rest of the fall were generally favorable. The hard freeze in January caused variable damage. Older plantings had the heaviest damage. Replanting, cutting back and planting were active after the freeze. Spring weather was mostly favorable except for heavy rains in the Pompano area. Yields were fair to good.

POTATOES 1981-82

Potato production in Florida in 1982, including both winter and spring, totaled 6.7 million cwt., up nearly 3 percent from the 1981 crop. A total of 30,800 acres were planted in 1982, about 1 percent more than the year before. Of the total acreage planted, 29,900 acres were harvested, the same as 1981. The value of the crop was placed at \$60.4 million, down 17 percent from the previous year. The decline in the value of the crop was due to a sharp drop in the average price received. The price received for all potatoes averaged \$8.95 per cwt. compared to \$11.10 in 1981.

The average yield was 226 cwt. per acre, a new record for Florida, exceeding the previous record by 6 cwt. In the three county Hastings area (Flagler, Putman and St. Johns) the average yield was 240 cwt., down slightly from 1981. Spring potatoes grown in other areas of the state had an average yield of 210 cwt., down 30 cwt. from the year before. However, the average yield for the winter crop was 185 cwt.,

up sharply from the previous winter of 155 cwt. and was responsible for pushing the all potato yield to the record level.

In south Florida where the winter crop is grown the red skin types are the dominant variety. Most of the winter production is sold for table stock. In the Hastings area the white skin varieties are the most important. Most of this production is used in the potato chip industry. However, potatoes used for table stock are increasing in importance.

Harvest of the winter crop got underway in late January and progressed slowly through most of March. Winter harvest was very active in late March and all of April. Digging of the spring crop was underway in late April and was very active during May. Harvest was completed in June. Acreage abandonment was about normal, caused mostly from flooding of low areas and freezing temperatures in January.

SPINACH FOR PROCESSING 1981-82

Spinach statistics have not been published separately for Florida in recent years to avoid disclosure of individual operations. However, data for these seasons have been included in the "Other Vegetables" series shown in this publication. Data for 1973 and earlier are available upon

request. Yields per harvested acre averaged about the same as a year earlier. Most of the crop is grown in the north central areas. The severe freeze in January caused a few problems.

SQUASH 1981-82

Florida's production of squash during the 1981-82 season, at 2.8 million bushels, was 18 percent above last year. The total of 16,600 acres harvested increased 12 percent from the previous year. The yield, at 168 bushels per acre, was up 9 bushels from last year.

The season average price of \$9.69 per bushel was down 3 cents from the 1980-81 season. Total cash receipts amounted to \$27.0 million. Monthly prices were generally above last year except during the winter months.

Florida produces acorn, butternut, yellow crookneck, yellow straightneck, white, and zucchini squash. Dade County, with 27 percent of the state's harvested acreage in 1981-82, produces yellow crookneck squash almost exclusively. The Pompano area, in addition to being a major producing area, is also an important market for squash grown in other areas of the state. This is especially true when local supplies reach low levels during the winter months. The southwest area produces a continuous supply of most types.

Central, north, and west Florida provide a good volume of most types during the fall and spring season.

Squash is one of the few crops grown in Florida that is shipped every month of the year, although shipments during the summer are light and mostly confined to local markets. Conditions were generally favorable during the fall, and marketings reached a fall peak in December. Record breaking cold temperatures in December killed nearly all plants above ground in the southwest area and damaged plants in other areas. An arctic front in January resulted in lost acreage of older plants and moderate to severe damage in younger plants. Replanting was heavy. Generally mild weather was favorable to plant recovery but reduced stands in freeze damaged fields lowered yields. Spring weather was generally favorable but heavy rains and disease problems lowered yields in the Pompano area. Peak marketings for the season occurred in April. The season was essentially complete by the end of June.

RADISHES
1981-82

In the 1981-82 crop year, radish plantings amounted to 27,700 acres compared with 32,900 acres planted during the previous year. Acres harvested totaled 24,500, 16 percent below the 1980-81 season. Yield per acre averaged 240 cartons compared with 247 cartons a year earlier. The crop was valued at a record \$23.8 million, up \$3.9 million from the previous year and 3 percent more than the previous record value in 1979-80. The average f.o.b. price was \$4.05 per carton, up \$1.26 from the 1980-81 season. Most monthly prices were above the corresponding prices a year earlier.

Good supplies of both red and white radishes were available from Zellwood, Lake Placid, and the Everglades from October through May with a light volume going into June. The peak fall harvest occurred in December. The spring peak occurred in May. Seeding of the 1981-82 crop was underway in the Everglades and the north central areas in early September. Light harvest was underway in early October. In November, considerable acreage was lost to locally heavy rains in the Everglades. Freezes in December and a severe freeze in January resulted in some crop damage. Supplemental supplies were available from Lake Placid and Sarasota during the year.

STRAWBERRIES
1981-82

Florida strawberry growers produced 8.1 million flats of berries during the 1981-82 season, up 45 percent from the previous year. Harvested acreage totaling 5,000 acres increased 56 percent from the previous year. Yields per acre averaged 1,625 flats compared with 1,750 flats the previous year. While yields were lower than the previous year, they have increased dramatically in recent years. High yielding and early maturing varieties have been introduced in the Hillsborough-Manatee area in recent years. The f.o.b. return per flat for the season was \$6.44, an increase of \$1.46 per flat over the previous season. The value of the crop was \$52.4 million, nearly double the \$27.9 million received for the 1980-81 season.

Laying of plastic and other field work was in full swing by late September and transplanting was very active by early October in the important Hillsborough-Manatee area. Transplanting was complete by early November. Plants made

good growth and a few blooms were showing by mid November. Light harvest got underway by mid December. Shipments reached a good volume in January and peaked in mid March. The January freeze caused some bloom loss and slowed growth somewhat. Most growers used sprinklers for icing over plants for protection against the freezing temperatures. Gradeout was heavier than normal after the freeze but quality and harvest improved by mid February. Market prices in January and February were below a year earlier while prices in March and April were higher. Growers opened most fields to U-Pic operations in mid-to-late March or early April. Quality and berry size were generally good during the season. U-Pic harvest continued into May. Harvest was underway in Bradford County in mid March. Quality was generally good. The harvest was virtually complete in early May. Most of the acreage in Dade County was for U-Pic and roadside stands.

TOMATOES 1981-82

The total value of the Florida tomato crop for fresh market and processing was \$266.3 million—up nearly 4 percent from the previous season. This was a record value for the state. The average price received for fresh tomatoes was \$5.23 per 25-pound carton, 26 cents less than the previous season.

Total production of 52.4 million 25-pound carton equivalents was 8 percent above last season and was the reason for the record crop value. Tomatoes utilized for the fresh market amounted to nearly 97 percent of the total while the remaining 3 percent went to processors. The processing segment is a secondary utilization, usually following the fresh market harvest. The Palmetto-Ruskin area accounted for 41.2 percent of the total production and Dade County 26.0 percent. The southwest which was hurt seriously by the January freeze, accounted for 23.5 percent of the total, the Ft. Pierce-Pompano area 6.2 percent and the remaining 3.1 percent was produced in the north, north central and western areas of the state.

The average yield for the state was 1,250 (25-pound) cartons, up 247 cartons from the 1980-81 season. Demand for Florida tomatoes was good during most of the season. Winter production was near normal even though the southwest suffered losses from a hard freeze in January. Dade County which leads in winter production had no major damage from the freeze. Fall production was down from the

year before. January was the peak month during the winter period accounting for 12.6 percent of the total production. February production was down, reflecting the damage caused by the freeze. The spring production peaked in May, which accounted for 26.6 percent of the entire season's total. Tomatoes are harvested from late October through early July.

The Palmetto-Ruskin area continued as the acreage leader with 14,900 acres harvested. Dade County continued in second place, harvesting 10,900 acres followed very closely by the southwest which harvested 10,800 acres. The southwest had some acreage lost due to the freeze. There were 2,500 acres harvested in the Ft. Pierce-Pompano area. Gadsden County accounted for the largest portion of the remaining acreage.

Tomato planting got underway in July except Dade County which did not get started until the first week of September. Planting made good progress during the fall as weather was mostly favorable until cold weather around mid December caused some problems. In January another freeze caused damage to tomatoes, mostly in the southwest. The other areas were spared any serious damage. The tomato crops were in good condition by the spring months and production was back to normal. Harvest was complete by early June in the southern-most areas but light harvest continued through June into early July in the other areas.

WATERMELONS 1981-82

Total plantings of watermelons during the 1981-82 season amounted to 56,000 acres, up 4 percent from the previous season. Of the total planted, 48,000 acres were harvested, down 2 percent from the year before. Abandonment was slightly higher than usual due to mostly weather related problems. Production was placed at 7.9 million cwt., down 2 percent from the 1980-81 season. The average yield for the state was 165 cwt. per acre. The area yields were rather variable ranging from 150 cwt. in the north to 210 cwt. in the south.

The average price was a record \$6.90 per cwt., up 38 cents from the previous season. Prices received by growers for melons were highest in the south and west central where the harvest begins early. The total value of the crop was a record \$54.6 million, up nearly 4 percent from the 1980-81 season.

The watermelon harvest got underway in late April for the first time in five years. The average price in April was rather low due mainly to very cold weather in the north

which reduced demand. Production increased sharply in May and so did prices.

There is a small acreage grown in the fall in the south and scattered central areas. These acres are usually harvested from November through January, depending on weather conditions. This acreage, yield and production are included in the following spring totals. The usual harvest season starts in the south in April, progresses northward into the central areas during May, the northern areas in June and usually ends in the Panhandle in July.

First plantings were made in the southwest during late December. Cold weather in January set the crop back and replanting was necessary. A combination of wet and dry conditions hurt the crop in the northern areas, increasing abandonment and lowering yields.

Harvest was underway in April, increased rapidly into May and peaked in June. Watermelons continued to be harvested in July but volume was less than normal. The season was over in all areas by the end of July.

OTHER CROPS 1981-82

Cantaloups are grown in Florida primarily in the southwest and north central areas. Much of the production is sold through roadside stands and local markets. The peak harvest period is normally May and June. Harvest begins in the southwest and progresses northward seasonally. There are some cantaloups grown during the fall months in the southwest and the west central areas. Acreage continues at a relatively low level. However, this crop is not part of the regular program for vegetables and melons. Researchers continue to work toward developing new varieties that will be better adapted to Florida's soils and climate. There appears to be some promise that acreage may expand in the future.

Cauliflower is grown in the Zellwood, Hillsborough-Manatee and Everglades areas. Acreage declined from a year earlier. Supplies are available from December to April. At the present time statistics are not available for publication. Shipment information is recorded by the Market News Service. In the 1981-82 season there were 52 thousand cwt. shipped out of the state compared with 77 thousand cwt. shipped the previous season. This converts to 236 thousand 22-pound cartons.

Tropical vegetable production during the 1981-82 season increased from the previous year. Damage from the January 1982 freeze was less severe than a year earlier; and weather was generally mild for the remainder of the winter. Improved fertilization and spray programs during the growing season contributed to good yields. By far the majority of the acreage is grown in Dade County. Commercial production began in the early 60's. Tropical vegetables is a colloquial expression applied to certain vegetables eaten primarily by those of Latin American and Carribbean origin. The most common name for each crop followed by the scientific name is listed below. Other common terms for various vegetables are shown in parentheses. The crops consist primarily of boniato-*Ipomeabatata* (sweet potato); calabaza-*Cucurbita* (pumpkin); malanga-*Xanthesoma caracu* or *Colocasia esculenta* (dasheen, yautia); and yucca-*Manihot esculenta* (cassava, crantz, tapioca). The boniato, calabaza and malanga constitute the bulk of the production. The Dade County Agricultural Extension Service reported 11,500 acres of tropical vegetables planted in the 1981 calendar year. Peak production of malanga occurs in February through April. Efforts are underway to even out the supply throughout the year. Available land continues to be a limiting factor for all agricultural production in Dade County. New varieties of calabaza are being brought in from Columbia, South America to

select those that do best in south Florida. Miami is an important point of consumption for the Florida production. Also, considerable amounts are consumed in the Tampa Bay area. The supplies shipped out of the state are primarily for the New York City and Philadelphia areas.

Collard, turnip, mustard and other greens are grown throughout the state and centered around large population areas and in the muck soils of the Everglades and Zellwood areas. Good volume is available November through March. Shipments totaled 57 thousand cwt. during the 1981-82 season, 20 thousand cwt. less than a year earlier.

Okra is grown in many areas of the state during the warm season of the year. However, Dade County produces okra for local use as well as for shipments to other states. Peak production takes place in May and June with a good supply in October and November.

Green onions and leeks are produced in the north central area. Supplies are marketed primarily for local use at roadside stands and markets. There are several large producers who ship to other states. Supplies of dry onions are limited. Most of the dry onions are produced in southern and west central areas of the state.

Parsley is available in both the curly and plain types. The bulk of the commercial volume shipped to other states is produced in the Everglades and Zellwood areas. Light supplies sold for local use are available from the Sarasota, Lake Placid and other areas.

Southern peas are grown primarily in the northwest, west central and Everglades areas of Florida. Dade County also produces a considerable amount of southern peas. Light supplies are available from September through December. Heavy movement occurs in May and June, especially in northwest Florida. A high percentage of the crop is utilized for processing. Good supplies are sold through local markets for fresh use. Market News Service shipment statistics for out-of-state markets show 19 thousand cwt. for fresh market during the 1981-82 season.

Watercress is available the year around. The major source of supply is the Oviedo area. Most of the production is shipped to northern and eastern markets in the United States. A limited supply is available from local state farmers markets, especially in the Sanford area.
