ACKNOWLEDGMENT

The acreage, production and value statistics in this bulletin are official state and USDA estimates prepared by the Florida Crop and Livestock Reporting Service. The county and area detail were made possible by the participation of the Department of Food and Resource Economics, University of Florida, in the estimating program. The Bureau of State Markets, Florida Department of Agriculture, and the County Extension Agents, University of Florida, Cooperative Extension Service, were also very helpful in supplying area and county information. Shipment statistics were provided by the Market News sections of the Florida Department of Agriculture and the USDA Agricultural Marketing Service.

Grower organizations have provided valuable assistance and data throughout the season. These groups include the Florida Celery Committee, Florida Tomato Committee, Florida Sweet Corn Exchange, South Florida Vegetable Exchange, Zellwood Sweet Corn Exchange, and North Florida Growers Exchange. Sales agencies and transportation firms provided the inputs necessary to complete the statistical story.

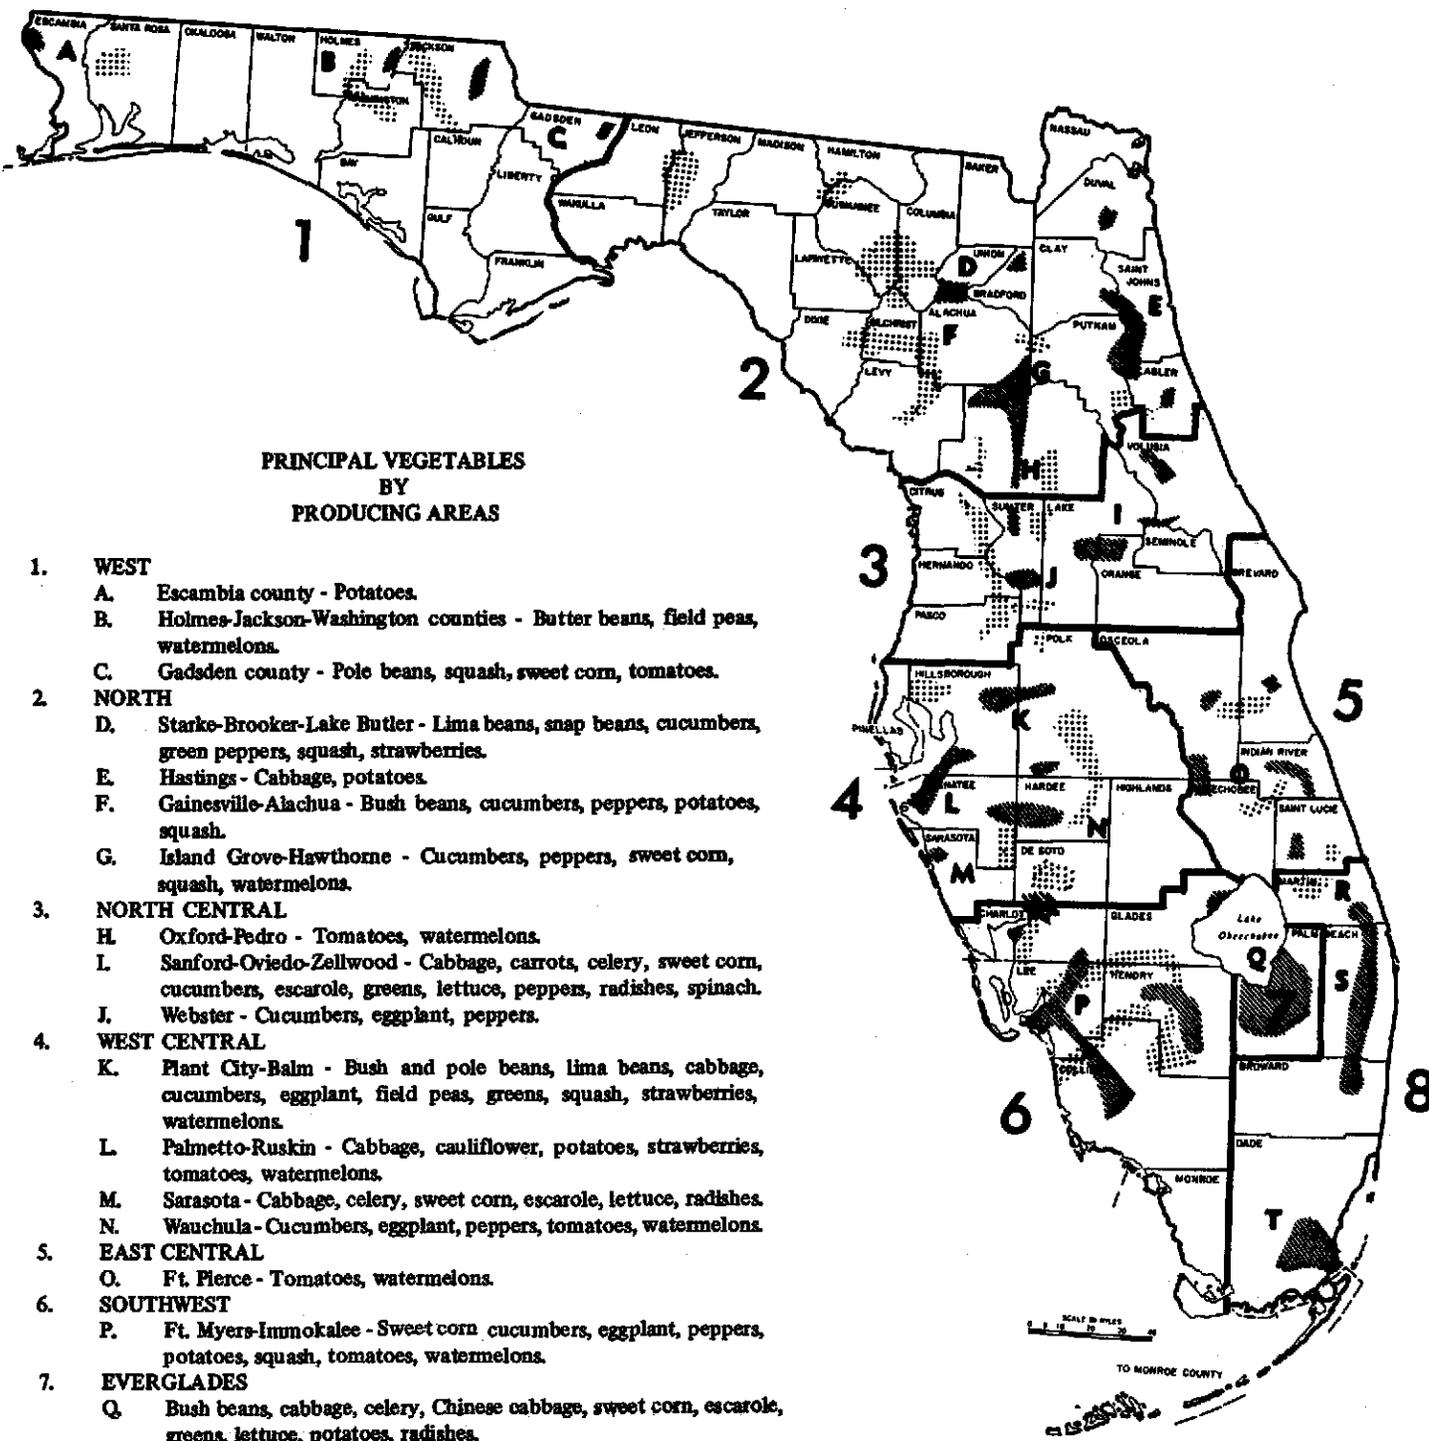

Foremost, the growers, shippers and processors volunteered most of the basic data used in developing these official statistics. The public spirited cooperation of these individuals and groups is appreciated.

Fieldmen James Spires, Immokalee; Charles Robertson, Homestead; Wallace Jacobs, North Palm Beach; and Larry Amlong of Palmetto collected much of the basic acreage, production and price statistics in this bulletin. This report was assembled under the direction of Ron Shannon, Gerald H. Moody and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service and E. F. Scarborough, Bureau of Market News. The authors also wish to thank Becky Altman, Diana Clingan, Ray Crickenberger, Marcelo Diaz, Kitty Hildreth, Barbara Palmer, Tommy Scherer, Cindi Shope, Pat Todd and others of the Florida Crop and Livestock Reporting Service who assisted in compiling and preparing this report.

**PRINCIPAL VEGETABLES
BY
PRODUCING AREAS**

1. **WEST**
 - A. Escambia county - Potatoes.
 - B. Holmes-Jackson-Washington counties - Butter beans, field peas, watermelons.
 - C. Gadsden county - Pole beans, squash, sweet corn, tomatoes.
2. **NORTH**
 - D. Starke-Brooker-Lake Butler - Lima beans, snap beans, cucumbers, green peppers, squash, strawberries.
 - E. Hastings - Cabbage, potatoes.
 - F. Gainesville-Alachua - Bush beans, cucumbers, peppers, potatoes, squash.
 - G. Island Grove-Hawthorne - Cucumbers, peppers, sweet corn, squash, watermelons.
3. **NORTH CENTRAL**
 - H. Oxford-Pedro - Tomatoes, watermelons.
 - L. Sanford-Oviedo-Zellwood - Cabbage, carrots, celery, sweet corn, cucumbers, escarole, greens, lettuce, peppers, radishes, spinach.
 - J. Webster - Cucumbers, eggplant, peppers.
4. **WEST CENTRAL**
 - K. Plant City-Balm - Bush and pole beans, lima beans, cabbage, cucumbers, eggplant, field peas, greens, squash, strawberries, watermelons.
 - L. Palmetto-Ruskin - Cabbage, cauliflower, potatoes, strawberries, tomatoes, watermelons.
 - M. Sarasota - Cabbage, celery, sweet corn, escarole, lettuce, radishes.
 - N. Wauchula - Cucumbers, eggplant, peppers, tomatoes, watermelons.
5. **EAST CENTRAL**
 - O. Ft. Pierce - Tomatoes, watermelons.
6. **SOUTHWEST**
 - P. Ft. Myers-Immokalee - Sweet corn, cucumbers, eggplant, peppers, potatoes, squash, tomatoes, watermelons.
7. **EVERGLADES**
 - Q. Bush beans, cabbage, celery, Chinese cabbage, sweet corn, escarole, greens, lettuce, potatoes, radishes.
8. **SOUTHEAST**
 - R. Martin county - Cabbage, potatoes, tomatoes, watermelons.
 - S. Pompano - Bush beans, lima beans, sweet corn, cucumbers, eggplant, peppers, squash, tomatoes.
 - T. Homestead - Bush and pole beans, cabbage, sweet corn, cucumbers, potatoes, squash, strawberries, tomatoes.

Summary of Shipments by Crops, by Months, 1982-83	--	--	48	--	

DEFINITIONS AND EXPLANATIONS

SEASONAL GROUPS—During the growing season, estimates were prepared for most crops on a six month seasonal group basis. The periods are for the crop year July-December and January through June. The two six month periods were combined in this publication into a crop year total for all crops. Production sold or utilized is shown by months.

PLANTED ACREAGE is the total acreage which has been planted for harvest during the crop year. Acreage lost and replanted to the same crop in time for harvest in the same quarter is counted only once. Acreage harvested and planted again to the same crop is counted twice.

HARVESTED ACREAGE is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

YIELD is the average production per acre of merchantable quality harvested and sold or utilized.

PRODUCTION is the quantity actually harvested and sold or utilized.

UNIT VALUE for fresh market sales is the equivalent price received, f.o.b. shipping point basis and encompasses all grades and sizes marketed or utilized. Included are packing charges, selling charges, precooling, top ice, or other costs which contribute to the value of the product at shipping point. The value per unit for quantities sold to processors is the average value paid for usable quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

TOTAL VALUE is the equivalent value of production sold or utilized based on the unit value. Cullage and other quantities not sold or utilized because of natural or economic factors are excluded.

OTHER COUNTIES include harvested acreage for all counties for which either published data would result in the disclosure of individual operations or acreage totals for specific commodities are of minor importance in the state.

All shipments and unloads, rail, truck, air and boat, are recorded nationally in 10,000 pound units each day. Annual releases are in 1,000 cwt. In this publication, shipments and unloads for some commodities were converted to most common trading units. Rail and piggyback weights and conversion factors were determined by several Market News Service field offices. Mixed car (rail) loadings by stations have been prorated by commodities.

Where possible, the national Market News Service in Washington, D. C. has established a single uniform weight per commodity to be used nationally in converting to weight units for the various means of transportation. Weights per common container used and number of units per rail car or truck may be obtained by writing the MNS office in Winter Park, Florida.

PRODUCTION AND PRICE UNIT—The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to what is believed to be the most commonly used containers. If changes in container weights are necessary, all data pertaining to the production of the commodity in question is revised to maintain comparability between years. The table below gives the net weight used per container and the number of containers per hundredweight.

PRODUCTION AND PRICE UNIT

Most common unit, estimated net weight, number of units per hundredweight, principal vegetable commodities, Florida, 1982-83 crop season

Commodity	Unit	Est. net weight	No. of units per cwt	Commodity	Unit	Est. Net weight	No. of units per cwt
		Pounds				Pounds	
Snap Beans	Bushel	30	3.333	Lettuce	Cwt	100	---
Cabbage	Crate	53	1.887	Green Pepper	Bushel	25	4.000

SUMMARY OF THE 1982-83 VEGETABLES SEASON

The farm value of Florida grown vegetables, melons, potatoes and strawberries sold in the 1982-83 crop year totaled \$1.1 billion, up \$164 million from the 1981-82 crop year. Acreage harvested was 4 percent above the previous year. Crops showing the greatest gains in harvested acres were carrots, sweet corn, watermelons, cabbage, green peppers, lettuce, tomatoes and strawberries. Crops increasing in value were snap beans, celery, sweet corn, cucumbers, green peppers, radishes, squash, tomatoes, watermelons and strawberries. Crops with lower values than the previous year were cabbage, carrots, eggplant, escarole, lettuce and potatoes. Most of the declines were due to lower season average prices. Tomatoes, which rose \$124.3 million, showed the greatest increase in value, followed by green peppers which increased \$34.1 million; celery, \$16.2 million; squash, up \$4.9 million and snap beans, up \$4.5 million from a year ago. Cabbage and lettuce showed the greatest declines, down \$10.9 million and \$10.5 million, respectively, from the previous year.

Average yields for cabbage, carrots, celery, snap beans, cucumbers, eggplant, escarole, lettuce, green peppers, radishes and squash increased during the year but yields declined for sweet corn, potatoes, tomatoes and strawberries.

Season average prices for celery, sweet corn, snap beans, cucumbers, green peppers, potatoes, radishes, squash, tomatoes and watermelons were higher than a year ago. Prices for cabbage, carrots, eggplant, escarole, lettuce and strawberries averaged below the previous season.

Land preparation, planting and transplanting were active in most areas of the state during July. Growing conditions were generally good to excellent over most of the farming areas during August. Planting activity progressed favorably. Showers and thundershowers were frequent the last of September and early October. Heaviest rains occurred in the west central area with some local crop damage reported. Numerous cold fronts during much of October and November interrupted planting and harvesting activities.

Temperatures were generally mild during most of December. A cold front entered the farming areas in late December, lowering temperatures into the 30's. The front was accompanied by light, scattered frost. Extensive leafburn occurred to tender cucumbers in the southwest and plant growth was slowed on most crops.

Much of January was characterized by numerous cold fronts and temperatures in the 30's and 40's. Light frost and cold winds caused light to moderate top foliage burn to

tender crops. A cold front at month's end was accompanied by moderate to heavy showers and strong winds. Rainfall amounts were significant, especially over south Florida, varying from 2 to 7 inches.

Unusually wet weather was predominant during February. Many sections of the state had more than double the normal rainfall. Field work was delayed by the very wet conditions. The adverse weather caused some wind and water damage to the vegetable areas.

A two-month-long period of below normal temperatures and above normal precipitation continued in March. Very strong, gusty winds accompanying the showers at month's end caused some plant damage. Some locally serious crop damage due to heavy hail was reported in Hillsborough County.

Sunny skies with warm days and mild nights dominated the first half of April in the vegetable areas. A cold front at midmonth brought cooler temperatures and showers. Record low temperatures were set over south and central Florida, April 25. Overnight records were in the 40's in north Florida and 50's in the south. Winds were light to moderate for the month.

The month of May was characterized by fair, dry weather with warm days and mild nights. Rainfall was spotty with many areas receiving little or no rain. Irrigation was very active to maintain soil moisture. Widespread rains beginning on May 29 were very beneficial as very little rain occurred during the month. Rainfall averaged 1-2 inches in central and southern areas and up to 3 inches in the lower southeast. Harvest was very active for some vegetables while declining for others.

In June, the weather was generally normal over most of the vegetable growing areas. Moderate to heavy thunder-shower activity occurred almost daily, but rainfall was variable by areas. Daytime highs were mostly in the 90's with nighttime lows in the 70's. Winds were light to moderate, gusty near showers. Crops were generally fair to very good in most areas.

Most of the weather data for this summary was supplied through the National Weather Service, U. S. Department of Commerce, Ruskin, Florida. Information on the effects of weather on crops was provided by the Florida Crop and Livestock Reporting Service fieldmen.

SNAP BEANS 1982-83

Florida growers produced 4.2 million bushels of bush and pole beans during the 1982-83 season for fresh and processing utilization, up 5 percent from a year earlier. Acreage harvested for fresh and processing totaled 47,000 acres, down 3 percent from the 48,300 acres harvested during the previous season. The average yield for the 1982-83 season was 90 bushels per acre for fresh market and 100 bushels per acre for processing, as compared with 82 bushels and 100 bushels, respectively, for the previous year.

The average f.o.b. price of \$10.60 per bushel for fresh market was 27 cents higher than the previous year. At \$3.00 per bushel, snap beans for processing remained at the same price as the previous season. Total value, at \$44.1 million, was 11 percent above last year.

Bush beans are grown in all areas of Florida with the exception of the east central and southwest areas. The southeast continues to be the major producing area. Pole beans are grown primarily in Dade County, with small acreages in Gadsden and Marion counties and the west central area.

Earliest fall supplies of snap beans originate from west Florida. The northern and west central areas, the Everglades and southeastern districts also provide fall production. The southeast is the sole source of supply during the winter. The other areas resume production in the spring.

Snap bean production extended from early October into mid June. The fall crop peaked in December. Marketings declined sharply in January and February. Production began to increase in March, and the spring crop peaked in April. Seventeen percent of the marketings occurred in April.

Wet weather adversely affected the 1982-83 bean crop. Heavy rains in late September, early October and November washed beds and leached fertilizer, necessitating reseedling in some areas. During the winter season, unusually heavy rains washed beds, delaying planting and harvesting activities. The wet fall and winter resulted in below normal yields and quality. Heavy rains during March continued to delay harvesting in the Pomapno area; however, weather the remainder of the spring was near ideal for beans. Quality and yields were generally good for the spring season.

CABBAGE 1982-83

Florida growers produced 6.4 million crates and bags of cabbage during the 1982-83 season. Production at this level is 10 percent more than the previous year. The gross value was \$22.7 million, a 33 percent decline from the previous year's total of \$33.6 million. The average f.o.b. price was \$3.52 per crate or bag, down \$2.23 from the \$5.75 received for the prior season's crop. The sharp drop in the average price received accounted for the big decline in value.

Total plantings were 16,300 acres, down 1 percent from the 16,500 acres planted during the 1981-82 season. A total of 14,700 acres were harvested, nearly 4 percent above the previous season. The average yield of 438 crates or bags per acre was up 27 from the season before.

Cabbage was available for market by late October and continued through June. Production during the fall months was down 14 percent from the previous fall. Production during the winter and spring period was up 13 percent from the year before. The peak months were February and March followed by April.

The Hastings area, which includes Flagler, Putnam and St. Johns counties, continued as the leading producing area. These counties accounted for 61 percent of the state's total production during the 1982-83 season. St. Johns County was the leading cabbage producing county in the state with 31 percent of the total acres harvested.

Planting was underway during late August and progressed rapidly into September. The most active period was October through December but continued into February. Transplanting is the main method of planting cabbage. There is still some interest in planting seed direct in the field but this method accounts for a very small portion of the total acreage planted.

Harvest began in late October, increasing slowly into December. Cutting picked up sharply in January, leveled off during February and March and then started to decline in April. There were no killing freezes during the winter and this period accounted for 56.7 percent of the total production. The spring months accounted for 36.3 percent of the total cabbage produced.

CARROTS 1982-83

Production of carrots in Florida for fresh market and processing utilization during the 1982-83 season totaled 1,100,000 cwt., up 19 percent from the previous season. Fresh use constituted 80 percent and processing 20 percent. This is the same as the previous year. Approximately 19 percent of the fresh carrots were mini or finger carrots compared with 21 percent a year earlier. The remaining 81 percent were the regular type carrots.

There were 10,000 acres harvested from the 10,600 acres planted during the 1982-83 crop year. This compares with 9,400 acres harvested from 10,500 acres planted a year earlier. Average price received for the 1982-83 crop was

^{Je}
\$10.50 per cwt. compared with \$14.30 per cwt. the previous year. Total value was \$11.6 million, down 12 percent from the \$13.2 million for the 1981-82 crop year.

The muck soils around Lake Apopka, near Zellwood and the Everglades, provide a good medium for growth. By far the majority of carrots are grown in the Zellwood area. The mini or finger carrot movement usually begins in late October or early November and ends by late May. Regular size carrots are harvested from November through June. The young carrots are subject to cold in January and February each year in the Zellwood area. Size and quality were good throughout the season.

CELERY 1982-83

Florida celery marketings of 6.3 million crates were harvested from 9,400 acres during the 1982-83 growing season. The average yield of 666 crates per acre compares with 537 crates the previous year.

Prices averaged higher than the previous year and at \$8.77 f.o.b. per crate, compared with \$7.58 per crate during the 1981-82 season. Prices during April, May and June averaged higher than the same months the previous year while prices during November through March averaged lower than the previous year.

The Everglades, with 85 percent of the harvested acreage in the state, was the foremost area of production throughout the season. The north central area supplemented by a light supply from the Sarasota area, accounted for the remaining 15 percent of acreage and provided continuous supplies during the season.

Plant bed preparation and seeding were underway by mid June. Transplantings were gaining momentum by late August and became active in September. Transplantings in the Everglades were interrupted by frequent rains during February. Plantings in the Everglades were winding down by the end of March and were complete by early April. Transplantings were complete in the central area in early May. Growers in the Sarasota area normally plant from October to March.

Light harvest began in early November in the Zellwood area and by mid November in the Everglades. Growing conditions were hot and humid in the summer and early fall months. The leaf miner was a problem in December, but effective spraying brought it under control. Cool weather during December and January was beneficial for growth and development. Quality was good early in the season and then improved from good to very good as the season progressed. Overall yields were about 24 percent above a year earlier.

No significant damage occurred from cold fronts moving into celery growing areas. The midwinter market was on the weak side but prices improved sharply during April, May and June. Prices averaged above year earlier levels. Approximately 3 percent of the crop was not harvested for various reasons. Growers passed some acreage in order to maintain good quality.

Celery production was most active December through May with May being the peak month. Cutting was completed in all areas by mid July.

Celery is subject to a federal marketing order administered by the Florida Celery Committee. Field supervisors provided the basic acreage and production data. In cooperation with the Celery Committee, these data are assembled into weekly, monthly and annual reports and published in this Annual Summary.

CHINESE CABBAGE 1982-83

Chinese cabbage is grown primarily on the mucklands of the Zellwood and Everglades area. The organic soils provide a very good medium for rapid growth. Harvest was underway by late November and reached a good volume in December. Production reached a peak level in January. Good volume continued through May.

During mid April, Zellwood was providing a good volume while the Everglades was declining seasonally. The season was over by June 1. Quality was mostly good throughout the season. No significant cold damage occurred. Shipments for the season totaled 129,000 cwt. compared with 100,000 cwt. a year earlier.

SWEET CORN 1982-83

Florida, the Nation's leading sweet corn producer for fresh sales, marketed 11.3 million crates during the 1982-83 season. Production increased 5 percent from the previous year. Harvested acres totaled 57,700 compared with 50,100 harvested the previous year. Yields averaged 196 crates per acre statewide compared with 215 crates per acre a year earlier. Heavy rains throughout the growing season reduced average yields to lower than normal levels in most areas. This is the first time since the record 244 crate average in the 1972-73 crop year, that the yield has averaged below 200 crates.

The season average f.o.b. price of \$5.74 per crate was 6 cents more than the \$5.68 per crate average in the 1981-82 crop season. The value of sweet corn ranked third in the state in vegetable crops and was exceeded only by the value of tomatoes and green peppers.

First plantings of the season were underway in the Everglades and Zellwood areas in July. Seeding along the southeast coast got underway in early October. First harvest began in the Zellwood area after mid September. The crop in the Everglades was slowed by heavy rains. Harvest got

underway by mid October and reached a peak in November. Harvest shifted from the Everglades to the southeast coast in December. By mid January Dade County began light harvest.

Harvest of the spring crop in the Everglades was underway by mid April. The Everglades became the main source of supply in late April as the East Coast and Dade County were nearing the end for the season. Spring harvest got underway in late May in the Zellwood area. Supplies declined seasonally in the Everglades by early June and the Zellwood area became the main source of supply into early July. The season was over by mid July.

A small acreage continued to provide supplemental supplies from Zellwood and the west central area during the early fall and from Sarasota in the early spring.

Weather was marked by heavy rains throughout most of the growing season. The rains interrupted plantings, washed beds and leached fertilizer in most areas. Yields were reduced by the adverse conditions. Quality and ear size were variable as the season progressed into late winter and early spring.

CUCUMBERS 1982-83

Florida's production of cucumbers for fresh market during the 1982-83 crop year was 4.7 million bushels, remaining even with the 1981-82 crop. The 15,900 acres planted for fresh market was down 200 acres from the previous year. Fresh market harvested acres totaled 15,000, a decrease of 300 acres from a year earlier. Average yield per acre for fresh market, at 316 bushels, was up 8 bushels from the previous season. Total fresh market production was valued at \$37.0 million compared with 33 million for the 1981-82 season. The fresh market price for 1982-83 averaged \$7.77 per bushel compared with \$7.00 the previous year.

Supplies in 1982-83 were generally available from October through June, with light marketings January through March. Many of the recorded shipments moving out-of-state January through March are from offshore and truck imports resold in mixed loads.

The production of cucumbers is well distributed across the state. The southwest area, with 39 percent of the planted acreage in 1982-83, is the largest area. The west central area accounted for 33 percent of the acreage in the state. The west, north, north central, and the southeast areas provide the remaining acreage.

The crop was in mostly good condition during late fall and winter but heavy rains caused some damage to fields in September. Strong, cold winds in late December slowed growth in the Pompano area. February was marked by strong winds, cold temperatures causing some burning and discoloration of leaves. Heavy rain in March was accompanied by strong winds that whipped plants causing leafburn and scarring of fruit. Poor weather restricted planting in the west central area. Conditions for the spring crop were mostly good although the season got off to a poor start due to adverse weather. Fruit quality, color and size were mostly good in the fall and winter but variable in the spring. Yields were variable most of the season.

EGGPLANT
1982-83

Plantings totaled 2,590 acres, down 2 percent from the 1981-82 season. Yields averaged 666 bushels per acre compared with 657 bushels for the previous season. Weather was generally favorable during much of the growing season. However, during early November, crop condition was lowered by heavy rains and strong winds. In mid February, strong winds whipped plants and scarred fruit. Growing conditions during the spring quarter were very good but plant size was smaller than normal. Fruit quality, color, size, and yields were mostly good.

Production of eggplant, at 1,666,000 bushels, was slightly above last year's production. Total sales decreased to \$8.4 million compared with \$9.6 million a year earlier. The decrease was due to a low price per bushel in the fall quarter because yield per acre and harvested acres were unchanged from 1981-82. The season average price of \$5.06 per bushel is 70 cents lower than a year ago. Compared with a year earlier, prices for most months were higher in the spring but lower in the fall and winter.

The distribution of marketings was generally normal. Harvest began in late September, reached a peak in November and dropped during the winter. Harvest began to increase in April and reached a peak in June. Harvest was virtually complete by July. The southeastern area around Pompano accounted for 55 percent of the harvested acreage. The northern and central areas combined contributed about 39 percent of the acreage harvested with the remaining acreage in the southwest.

Production is generally continuous throughout the entire crop year in the southeast and southwest. The crops in the western, northern, and central areas are for fall and spring harvest only because these areas receive too much freezing weather to grow eggplant during the winter months.

First sales were from cuttings in the western and northern areas in late September. Harvest followed the usual pattern and progressed southward in the fall, continued through the winter in the southern areas, and then moved back northward in the spring.

ESCAROLE-ENDIVE
1982-83

Production of escarole and endive during the 1982-83 season totaled 2.9 million crates, up 7 percent from a year earlier. The 5,600 acres harvested were up 6 percent from the previous year. Yield per acre averaged 519 crates compared with 512 crates the previous year.

Prices during the season averaged \$5.17 per crate, compared with \$6.65 a year earlier. Prices were lower than a year earlier in every month of marketings except March and April. Total value of sales, at \$15.0 million, was 17 percent below the previous year. The Everglades, which had 69 percent of the harvested acreage in the 1982-83 season, began seeding in late August. Weekly plantings continued through March. Light harvest began in early November and was continuous into early June. The mucklands around Zellwood provided

good volume in the late spring months. The small acreage grown around Lake Placid and Sarasota mucklands furnished supplemental supplies during much of the season.

Sales started slowly in late October and increased to good volume by mid November. Marketings reached peak levels in the December-through-May period. Sales were complete for the season by mid June.

Growing conditions were generally favorable during most of the season. However, rains during late February and early March interrupted harvest activity. Some light cold damage to outer leaves occurred in early January. Quality of escarole and endive was mostly good throughout the season.

LETTUCE 1982-83

Florida lettuce growers produced 2.5 million cwt. during the 1982-83 season, up 9 percent from the previous year. A 5 percent increase in harvested acreage along with an increase of 7 cwt. per acre contributed to the increase in production. Average yield of 190 cwt. per acre compares with 183 cwt. per acre for the previous season. Growers harvested 12,900 acres compared with 12,300 acres the previous year. The season average f.o.b. price of \$18.83 per cwt. was below the \$25.16 per cwt. received the previous year. Monthly prices through April were below a year earlier. Prices during the winter quarter were well below the previous winter.

Acreage, production and value statistics of lettuce in this bulletin combine the various types into a single estimate. The types in order of importance include iceberg, romaine, Boston, bibb and leaf.

The Everglades muckland accounted for 86 percent of the planted acreage and was the source of a continuous supply of good quality lettuce which began in late October and early November and continued through May. Outside the Everglades, Zellwood is the other major producing area,

with Sarasota and the Lake Placid mucksoils contributing light supplies during most of the season.

Seeding was underway in late August. All areas were actively planting by late September. The Everglades and Sarasota areas had continuous plantings through March.

Very light harvest of specialty types was underway by late October and continued light until mid November. Volume gained significantly in December and continued heavy through May. The Everglades continued to provide the bulk of the volume during the winter period. Virtually all of the iceberg type is grown in the Everglades. Harvest was completed in all areas by late May. Volume from the Zellwood area was light during the winter months. Moderate supplies are available from this area during the fall and spring seasons.

Growing conditions in the early fall were hot and humid. Frequent rains interrupted cutting for several days in late January. Growth was generally very good. Heavy volume was available statewide during April and May. Quality was generally good throughout the season.

PEPPERS 1982-83

Florida produced 9.5 million bushels of peppers during the 1982-83 season, an increase of 20 percent from the previous year. The average yield of 482 bushels per acre was 17 percent above the 412 bushels per acre last season. Harvested acreage, at 19,700 acres, was 2 percent more than the 19,300 acres harvested in 1981-82.

The season average f.o.b. price of \$9.45 per bushel was up from an average of \$7.00 for the previous season. The total value of \$89.7 million was 61 percent above the previous year. Prices were above last year except for October through December. Prices in January through April were well above the previous year. Marketings were light in October but increased to a good level by December. Supplies decreased slightly in February and March but began an upward swing in April. The peak spring production occurred in May. The season then declined and was mostly over by the end of June.

Total planted acreage remained about the same as the previous season. Increases in acreage for the west central and southeast areas were offset by decreases for the north central and southwest. The acreage in the north area did not change from the previous year. The important southwest area accounted for 37.5 percent of the state's total pepper acreage. The southeast had 34.8 percent; the west central area, 9.5 percent; the north area, 9.3 percent; and the north central area, 8.8 percent.

Heavy rains during late September necessitated resetting in some fields to restore normal stands. Peppers suffered somewhat from the rains, but most beds were plastic covered and received little damage. Rains again in the winter and spring caused some leaching of fertilizer and a delay in harvest. Crop condition in the spring was generally good despite the wet weather. Yields were good.

POTATOES 1982-83

Potato production in Florida during 1983, including both winter and spring crops, totaled 5.8 million cwt., 13 percent less than the 1982 crop. A total of 30,600 acres were planted for 1983 harvest. Out of this total, 29,800 acres were harvested, less than 1 percent below the acreage harvested in 1982. The value of the crop was placed at \$54.4 million—down 10 percent from the previous year. The decline in value was due to the drop in production. The average price received for all potatoes was \$9.30 per cwt., up 35 cents from the year before.

The average yield for all seasons combined was 196 cwt. per acre. In the Hastings area which includes Flagler, Putnam and St. Johns counties, the average yield was 215 cwt. per acre, down 25 cwt. from last year. Spring potatoes grown in other areas of the state had an average yield of 155 cwt. per acre. This was a sharp drop from the 210 cwt. average of 1982. The average yield for the 1983 winter crop—

140 cwt. per acre—was down sharply also, and the lowest since 1972. The lower yield was caused by flooding of fields early in the season.

The dominant varieties grown in south Florida are red skinned. Most of the winter production is sold on the open market and used as table stock. In the Hastings area the white skin varieties are the most important. Most of the Hastings production goes to the potato chip industry, although, fresh market or table stock sales are increasing in importance.

The winter crop harvest got underway in late January. Harvest was most active during March and April. Digging of the spring crop started at the end of April and was most active during May. Harvest was completed in June. Acreage abandonment was considered normal and was caused by flooding of low areas during the early growing season.

SPINACH FOR PROCESSING 1982-83

Spinach statistics have not been published separately for Florida since 1973 in order to avoid disclosure of individual operations. However, data since then have been included

in the "other vegetable" series shown in this publication. Yields per harvested acre averaged slightly below a year earlier. Most of the crop is grown in the north central area.

SQUASH 1982-83

Florida's production of squash during the 1982-83 season, at 2.9 million bushels, was 3 percent above last year. The total of 16,100 acres harvested decreased 3 percent from the previous year. The yield, at 179 bushels per acre, was up 11 bushels from last year.

The season average price of \$11.12 per bushel was up \$1.43 from the 1981-82 season. Total cash receipts amounted to \$32.0 million. Monthly prices were above a year earlier except for October and December.

Florida produces acorn, butternut, yellow crookneck, yellow straightneck, white, and zucchini squash. Dade County, with 28 percent of the state's harvested acreage in 1982-83, produces yellow crookneck squash almost exclusively. The Pompano area, in addition to being a major producing area, is also an important market for squash grown in other areas of the state. This is especially true when local

supplies reach low levels during the winter months. The southwest area produces a continuous supply of most types. Central, north, and west Florida provide a good volume of most types during the fall and spring season.

Squash is one of the few crops grown in Florida that is shipped every month of the year, although shipments during the summer are light and mostly confined to local markets. The 1982-83 season got off to a fair to good start as heavy rains caused some minor problems. Marketings increased to a fall peak in November, before showing a seasonal decline during the winter months. Cold winds and scattered frost in mid January caused light to moderate windburn on foliage. Pompano was hit with heavy rains in February and March. Rains washed beds, leached fertilizer and lowered plant condition. Weather was favorable during the spring quarter, and production was heavy. Peak marketings for the season occurred in May.

RADISHES 1982-83

In the 1982-83 crop year, radish plantings amounted to 27,400 acres compared with 27,700 acres planted during the previous year. Acres harvested totaled 24,700, 1 percent above the 1981-82 season. Yield per acre averaged 247 compared with 240 cartons a year earlier. The crop was valued at a record \$27.9 million, up \$4.1 million from the previous record a year earlier. The average f.o.b. price was \$4.58 per carton, up 53 cents from the 1981-82 season.

A good supply of both red and white radishes was available from Zellwood, Lake Placid, and the Everglades from October through June. The peak fall harvest occurred in November. The spring peak occurred in April. Seeding of the 1982-83 crop was underway in the Everglades and the north central areas in early September. Light harvest was underway in early October and became quite active in mid November. Heavy rains interrupted digging in February. Supplemental supplies were available from Lake Placid and Sarasota during the year.

STRAWBERRIES 1982-83

Florida strawberry growers produced 8.6 million flats of berries during the 1982-83 season, up 5 percent from the previous year. Harvested acreage totaling 5,400 acres increased 8 percent from the previous year. Yields per acre averaged 1,583 flats compared with 1,625 flats the previous year. While yields were lower than the previous year, they have increased dramatically in recent years. High yielding and early maturing varieties have been introduced in the Hillsborough-Manatee area in recent years. The f.o.b. return per flat for the season was \$6.14, a decrease of 30 cents per flat from the previous season. The value of the crop was \$52.5 million, about the same as a year ago.

Laying of plastic and other field work were in full swing by late September and transplanting was very active

by mid October in the important Hillsborough-Manatee area. Transplanting was complete by mid November. Some scattered blooms on early plantings occurred in late November and light harvest was underway by mid December. Picking increased and shipments got underway in January. Peak movement occurred in April. Most of the commercial harvest was completed by late April. U-Pic harvest continued active during May. Plant growth was good. Heavy rains in February and March damaged mature berries and delayed picking. Volume was up sharply by mid March. Quality and size were very good. Harvest was underway in Bradford County by mid March and the season was drawing to a close around late May. Most of the acreage in Dade County was for U-Pic and roadside stand operations.

TOMATOES 1982-83

The total value of the Florida tomato crop including fresh market and processing was \$390.6 million—up nearly 47 percent from the 1981-82 season. This was a record value for the state. The higher value for the crop can be attributed to a higher price per crate and a sharp increase in acreage harvested.

Total production of 54.1 million 25-pound carton equivalents was up 3 percent and a new production record for the state. Tomatoes utilized for the fresh market amounted to slightly over 97 percent of the total while the remaining 3 percent went to processors. The processing segment is a secondary utilization, usually following the fresh market harvest. The Palmetto-Ruskin area accounted for 39.5 percent of the total production and Dade County 28.4 percent. The southwest had 21.7 percent, Ft. Pierce-Pompano, 6.3 percent and the remaining 4.1 percent was produced in the north, north central and western areas of the state.

The average yield for the state was 1,154 (25-pound) cartons, down 96 cartons from the 1981-82 season. Demand for Florida tomatoes remained strong during the season. *Harvest continued into July. Both the winter and spring production were near normal. Heavy rains and a cool spring*

reduced yields on the early spring acreage. However, a longer than usual harvesting period helped to keep yields up some. Dade County continues to be the major winter producing area. Fall production was up from the year before due to an increase in acreage as yields were down slightly. January was the peak month during the winter, accounting for 13.9 percent of the year's total while May was the peak month in the spring, accounting for 16.8 percent of the total.

The Palmetto-Ruskin area was the acreage leader with 17,200 acres harvested followed by Dade County with 12,900 acres. The southwest area had 10,400 acres harvested and the Ft. Pierce-Pompano area harvested 3,000 acres. Gadsden County, with 1,200 acres harvested, accounted for the largest portion of the state's remaining acreage.

Planting got underway in the Palmetto-Ruskin area in July. All other areas started shortly afterwards except Dade County where planting begins in September. Harvest got underway in October and continued into early July in the southern areas. Light harvest continued through July in the other areas.

WATERMELONS 1982-83

Total plantings of watermelons amounted to 59,000 acres during the 1982-83 season. This was an increase of 5 percent over the 1981-82 season. Of the total planted, 49,000 acres were harvested, up 2 percent from the previous season. Abandonment continued to be very high due to weather related problems and market fluctuations during the season. Production was placed at 8.1 million cwt., up 2 percent from the previous season. The average yield was 165 cwt. per acre, the same as last year. The yields by areas were rather variable, ranging from 134 cwt. in the Panhandle to 190 cwt. in the south.

The average price was a record \$7.20 per cwt. up 30 cents from last season. Prices received by growers were the highest in the south and central areas where harvest begins early. The total value of the crop was placed at \$58.2 million, a new record for the state. This was nearly 7 percent above the previous record set last year.

The watermelon harvest did not get underway until May and was very active during June and July. The season was delayed by a cool, wet spring which extended into the

southern portion where the early harvest begins. Price was very good for early melons and held up a little longer than usual.

There is a small acreage of fall grown watermelons in the south and scattered central areas. These melons are harvested in November and December, depending on weather conditions. This acreage and production are included in the following spring crop. The usual harvest begins in April in the south. The harvest progresses northward in the central areas during May, through the north during June and usually ends in the Panhandle during July.

First plantings are in the southwest in late December or early January. Cool, wet weather slowed seed germination and some fields had to be replanted because of poor stands. *The cool weather continued into the spring months.*

Harvest did not get underway until late May but moved rapidly and peaked in June. Harvest continued active through most of July. The season was over by very early August.

OTHER CROPS
1982-83

Cantaloups are grown in Florida primarily in the southwest and north central areas. Much of the production is sold through roadside stands and local markets. The peak harvest period is normally May and June. Harvest begins in the southwest and progresses northward seasonally. There are some cantaloups grown during the fall months in the southwest and west central areas. Acreage continues at a relatively low level. However, this crop is not part of the regular program for vegetables and melons. Researchers continue to work toward developing new varieties that will be better adapted to Florida's soils and climate. There appears to be some promise that acreage may expand in the future.

Cauliflower is grown in the Zellwood, Hillsborough-Manatee and Everglades areas. Acreage increased from a year earlier. Supplies are available from December to April. At the present time statistics are not available for publication. Shipment information is recorded by Market News Service. In the 1982-83 season there were 86 thousand cwt. (391 thousand 22-pound cartons) shipped out of the state compared with 52 thousand cwt. shipped the previous season.

Tropical vegetable production during the 1982-83 season decreased slightly from the previous year due primarily to an above average water table in 1982 that reduced the yield. By far the majority of the acreage is grown in Dade County. Commercial production began in the early 60's. Tropical vegetables is a colloquial expression applied to certain vegetables eaten primarily by those of Latin American and Caribbean origin. The most common name for each crop followed by the scientific name is listed below. Other common terms for various vegetables are shown in parenthesis. The crops consist primarily of boniato-*Ipomea batata* (sweet potato); calabaza-*Cucurbita* (pumpkin); malanga-*Xanthosoma caracu* or *Colocasia esculenta* (dasheen, vautia); and cassava-*Manihot esculenta* (crantz, yucca topioca). The boniato, Calabaza and Malanga constitute the bulk of the production. The Dade County Agricultural Extension Service reported 11,400 acres of tropical vegetables planted in the 1982 calendar year. Peak production of malanga occurs in February through April. Efforts are underway to even out the supply throughout the year. Available land continues to be a limiting factor for all agricultural production in Dade County. New varieties of calabaza are being brought in from Columbia, South America to select those that do best in south Florida. Miami is an important point of consumption for the Florida

production. Also, considerable amounts are consumed in the Tampa Bay area. The supplies shipped out of the state are primarily for the New York City and Philadelphia areas.

Collard, turnip, mustard and other greens are grown throughout the state and centered around large population areas and in the muck soils of the Everglades and Zellwood areas. Good volume is available November through March. Shipments totaled 42 thousand cwt. during the 1982-83 season, 15 thousand cwt. less than a year earlier.

Okra is grown in many areas of the state during the warm season of the year. However, Dade County produces okra for local use as well as for shipments to other states. Peak production takes place in May and June with a good supply in October and November.

Green Onions and leeks are produced in the north central area. Supplies are marketed primarily for local use at roadside stands and markets. There are several large producers who ship to other states. Supplies of dry onions are limited. Most of the dry onions are produced in southern and west central areas of the state.

Parsley is available in both the curly and plain types. The bulk of the commercial volume shipped to other states is produced in the Everglades and Zellwood areas. Light supplies sold for local use are available from the Sarasota, Lake Placid and other areas.

Southern peas are grown primarily in the northwest, west central and Everglades areas of Florida. Dade County also produces a considerable amount of southern peas. Light supplies are available from September through December. Heavy movement occurs in May and June, especially in northwest Florida. A high percentage of the crop is utilized for processing. Good supplies are sold through local markets for fresh use. Market News Service shipment statistics for out-of-state markets show 23 thousand cwt. for fresh market during the 1982-83 season.

Watercress is available the year around. The major source of supply is the Oviedo area. Most of the production is shipped to northern and eastern markets in the United States. A limited supply is available from local state farmers markets, especially in the Sanford area.
