ACKNOWLEDGMENTS

The acreage, production, and value statistics in this bulletin are official State and USDA estimates prepared by the Florida Agricultural Statistics Service. Extended commodity coverage and county and area detail were made possible through the participation of the Department of Food and Resource Economics, University of Florida, in the estimating program. The Bureau of State Farmers' Markets, Florida Department of Agriculture, and the County Extension Agents of the Cooperative Extension Service were also very helpful in supplying area and county information. Shipment statistics were provided by the Market News Section of the Florida Department of Agriculture and the USDA Agricultural Marketing Service.

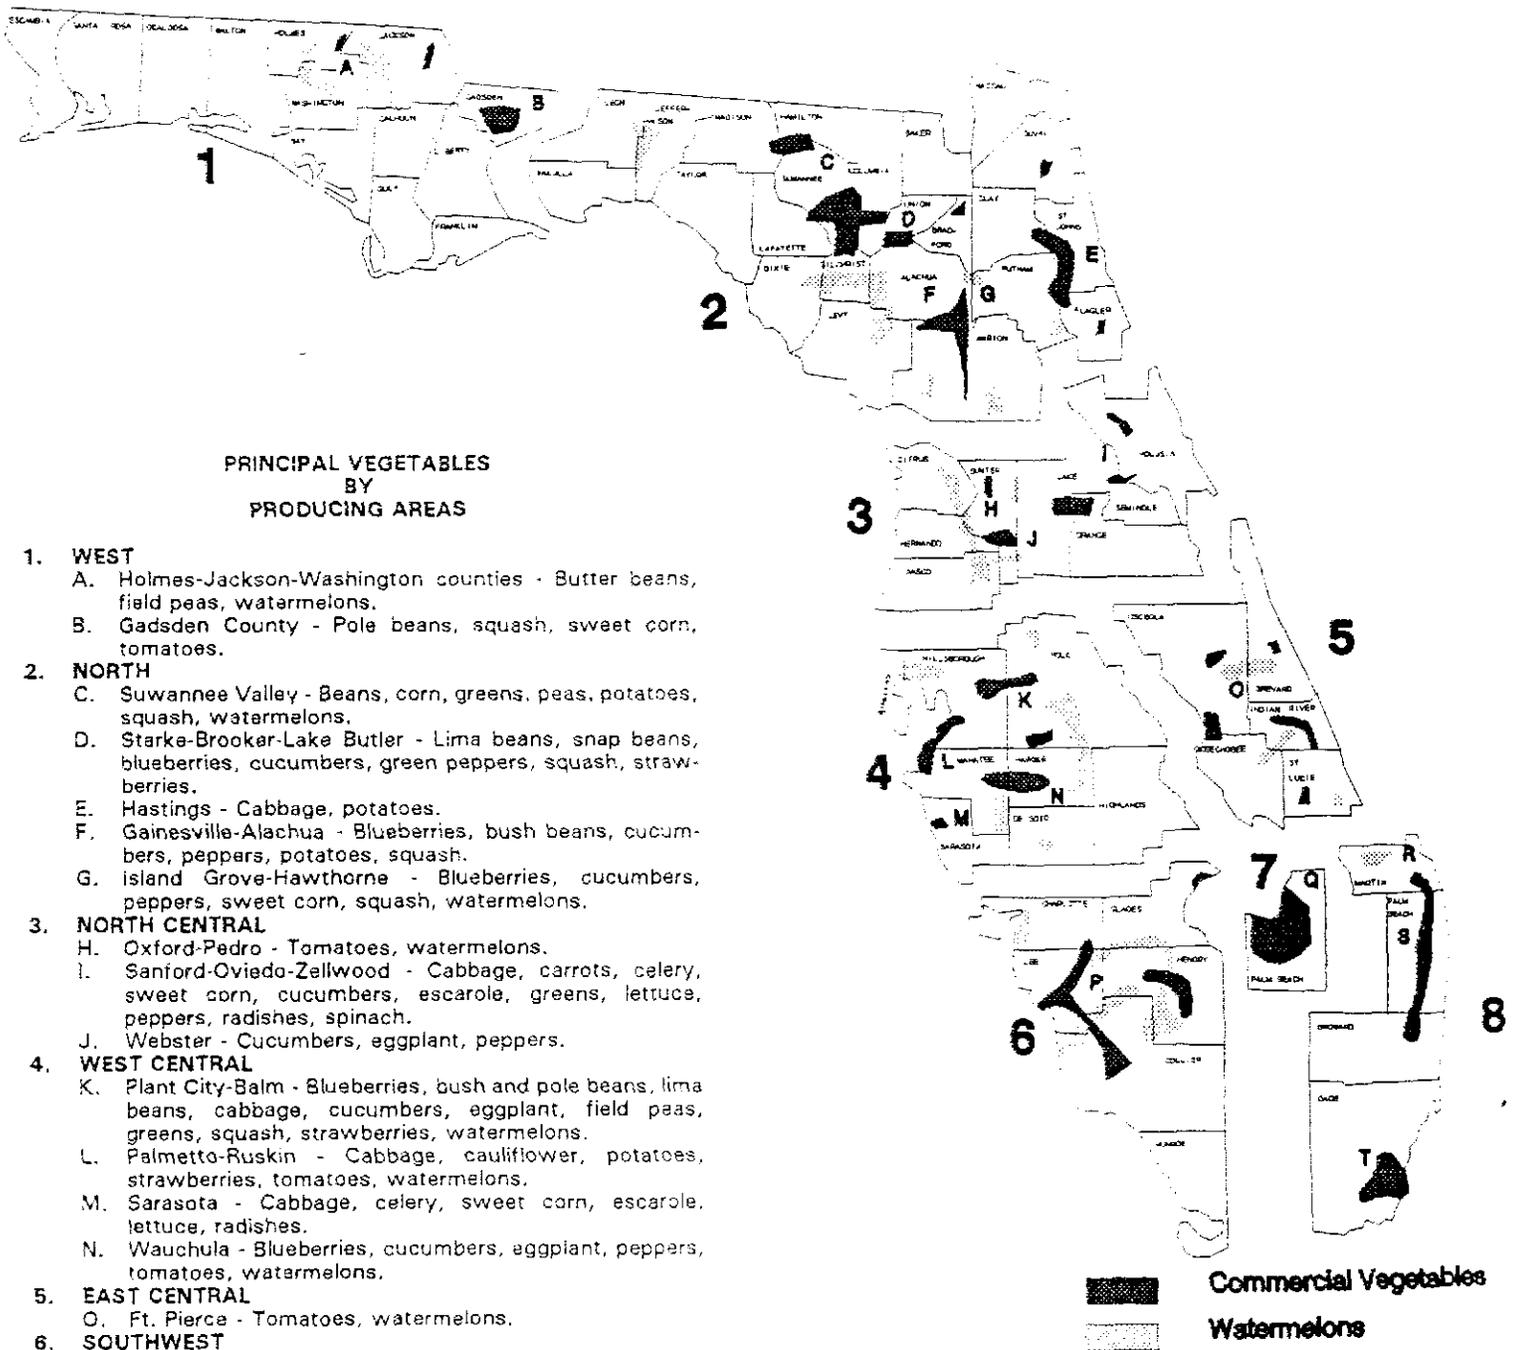

Grower organizations have provided valuable assistance and data throughout the season. These groups include the Florida Celery Committee, Florida Tomato Committee, Florida Sweet Corn Exchange, South Florida Vegetable Exchange, Zellwood Sweet Corn Exchange, and North Florida Growers Exchange. Sales agencies and transportation firms provided additional inputs needed to complete the statistical story.

Foremost, the growers, shippers, and processors volunteered most of the basic data used in developing these statistics. The public spirited cooperation of these individuals and groups is appreciated.

Field personnel A.J. Wilson, Parrish; E.J. Hutchins, Deerfield Beach; Charles Robertson, Homestead; Carl Ouzts, Orlando, and James Spires of Immokalee collected much of the basic acreage and production data in this bulletin. This report was assembled under the direction of Wade Adams with assistance from Shirley Zonner and Karl Schmidt of the Florida Agricultural Statistics Service and H.B. Buchanan, Market News Section. The authors also wish to thank, Marcelo Diaz, Kitty Hildreth, Pat Quittance, Tommy Scherer, and others of the Florida Agricultural Statistics Service who assisted in compiling and preparing this report.

Summary of Shipments by Crops, by Months, 1991-92	--	--	56	--

DEFINITIONS AND EXPLANATIONS

SEASONAL GROUPS--State level estimates for most crops are estimated on a six month seasonal basis. These statistics are published in January. The periods are for the crop year July through December and January through June. The two six month periods were combined in this publication into a crop year total for all crops. Production sold or utilized is shown by months.

PLANTED ACREAGE is the total acreage which has been planted for harvest during the crop year. Acreage lost and replanted to the same crop in time for harvest in the same quarter is counted only once. Acreage harvested and planted again to the same crop is counted twice.

HARVESTED ACREAGE is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

YIELD is the average production per harvested acre of merchantable quality harvested and sold or utilized.

PRODUCTION is the quantity actually harvested and sold or utilized.

UNIT VALUE for fresh market sales is the equivalent price received, f.o.b. shipping point basis and encompasses all grades and sizes marketed or utilized. Included are packing charges, selling charges, precooling, top ice, or other costs which contribute to the value of the product at shipping point. The value per unit for quantities sold to processors is the average value paid for usable quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

TOTAL VALUE is the equivalent value of production sold or utilized based on the unit value. Cullage and

other quantities not sold or utilized because of natural or economic factors are excluded.

OTHER COUNTIES include harvested acreage for all counties for which either published data would result in the disclosure of individual operations or acreage totals for specific commodities are of minor importance in the State.

All shipments and unloads, rail, truck, air, and boat, are recorded nationally in 10,000 pound units each day. Annual releases are in 1,000 cwt. In this publication, shipments and unloads for some commodities were converted to most common trading units. Rail and piggyback weights and conversion factors were determined by several Market News Service field offices. Mixed car (rail) loadings by stations have been prorated by commodities.

Where possible, the national Market News Service in Washington, D. C. has established a single uniform weight per commodity to be used nationally in converting to weight units for the various means of transportation. Weights per common container used and number of units per rail car or truck may be obtained by writing Federal-State Market News, P.O. Box 1148, Winter Park, Florida 32790.

PRODUCTION AND PRICE UNIT--The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to what is believed to be the most commonly used containers. If changes in container weights are necessary, all data pertaining to the production of the commodity in question are revised to maintain comparability between years. The table below gives the net weight used per container and the number of containers per hundred-weight for Florida produce.

Most common unit, estimated net weight, and units per hundredweight, Florida produce, 1991-92 crop season

Commodity	Unit	Est. net weight	No. of units per cwt	Commodity	Unit	Est. Net weight	No of units per cwt

SUMMARY OF THE 1991-92 SEASON

The value of Florida-grown vegetables, melons, potatoes, and strawberries sold in the 1991-92 crop year totaled \$1.73 billion, 4.4 percent above the 1990-91 year and a new record high. The increase in value of production resulted from increased production as the season average prices were lower for all crops except cabbage and strawberries.

The 1991-92 harvested area was 377,175 acres, up 5.6 percent from the previous year. Both planted area and percentage of acres harvested increased. Harvested area was up most for snap beans, cucumbers, and eggplant and decreased for cabbage and strawberries. Yields were up for 12 of the 16 major crops. Yield increased most for carrots, green peppers, tomatoes, potatoes, and strawberries and decreased most for sweet corn, lettuce, and radishes.

Field work started in mid-July and by early August growers were planting in the north. In September, planting was active in all areas and harvest began in the north. In October, harvesting started in the central area and planting was active in the south. Rain hampered field activity along the southeast coast in mid-October. From November through December, harvesting activity moved from the north through the central area into the south. Planting of spring crops started in late December, intensified in the southern areas in January, with potato planting starting in the Hastings area. Fieldwork in February was hampered by rain. Growers had to take precautions for freezing temperatures in mid-March. By the end of March, harvesting activities were beginning in the central producing areas. Dry weather forced growers to maintain irrigation schedules through April. In April, harvesting had begun in the central area and had moved north by the end of May. Harvesting of most central area crops was winding

down by mid-June, and was complete by late June. Harvesting continued in the north until the season was complete in mid-July.

September started cooler and showers delayed some fieldwork, but normal temperatures and frequent showers came at month's end. In early October, temperatures were 10 to 15 degrees below normal, which aided setting and sizing of most vegetables. Early November had near freezing temperatures in the Panhandle but no damage was reported. In mid-December, strong gusty winds caused leaf burn and stem damage. Irrigation schedules were maintained to combat dry soil conditions.

Dry conditions continued into January. Freezing temperatures came in mid-month and again at month's end to the central areas, but winds kept frost to a minimum. In the first week of February, gusty winds tossed some vine crops around, causing limited fruit scarring. Rain slowed fieldwork and high winds lowered crop conditions in the south. In March, heavy rains fell in the central area and moderate rain fell in the south. Month's end brought heavy rains and hail, lowering crop condition somewhat.

Light frost in early April damaged watermelon plants in the north. Strong winds and blowing sand at the end of April lowered crop conditions. May began with below normal temperatures. There was some leafburn in isolated northern localities, and strong winds tossed crops around but the lower temperatures minimized damage from dry soil conditions. At the end of June, a tropical disturbance brought heavy rain to the south. Several inches of rain also fell in early July. Typical Florida summertime afternoon showers and warm temperatures ended the season in mid-July.

SNAP BEANS 1991-92

Bush beans are grown in most areas of the State. The southeastern area (Homestead and Pompano) continued as the major production area with an increase noted for the Everglades. Pole beans are grown primarily in Dade County with a small amount grown in the north.

The State's growers produced 6.0 million bushels of snap beans for fresh market and processing during the 1991-92 season, up 59 percent from a year earlier. Harvested acreage for both fresh and processing totaled 31,410 acres compared with 21,550 acres harvested during the 1990-91 season. A small decrease of 140 acres for the processing acreage was offset by a large increase of 10,000 acres for the fresh market acreage. The 1991-92 yields of 192 bushels per acre for the fresh market crop and 189 bushels per acre for the processing crop also set new record highs.

The f.o.b. price of \$12.97 per bushel for fresh market beans was 57 cents lower than the price of \$13.54 per bushel a year earlier. However, the increase in harvested acreage combined with the record high yield caused the value of the fresh market crop to jump to a new record high of \$76.9 million. Processing beans averaged \$3.77 per bushel, up 33 cents from a year earlier.

Central and southern area growers started planting in early September while harvest of the northern crop

began in late September. Excessive rain over Dade County during September caused some plant stress. Harvest in central regions began after mid-October while Dade County and Pompano growers started picking by early November. The arrival of freezing temperatures in mid-November brought the northern harvest to a halt. Harvest of the central area crop continued until cold temperatures arrived in late November. Mild conditions throughout December and January allowed steady planting and harvesting in southern areas. Strong winds in early February buffeted Dade County plants with only slight damage occurring. Warm weather in late February aided growth and development. Spring crop planting began in northern and central regions by early March. A cold spell during mid-March caused no significant damage to young northern fields. Southeastern producers continued to plant through early April. Cool temperatures near mid-April slowed growth in northern fields with warmer weather later in the month spurring bean development in the area. Spring crop picking began around mid-April in central areas. Frosty temperatures during early March lowered the condition of some northern fields with harvest underway by mid-month. Homestead and Pompano growers completed picking by early June, while central producers finished by mid-June. The northern harvest was nearing completion in late June.

BLUEBERRIES 1991-92

The acreage of blueberries harvested in 1991-92 was 1,200 acres. Production was an estimated 2,100,000 pounds, for a yield per acre of 1,750 pounds. The value per pound was \$1.64, and the total value of the crop was \$3,439,000. Estimates of acreage, production, and value were begun in Florida for the 1991-92 season.

Harvesting of blueberries occurs between mid-April and early June. The majority of the acreage is in the northern counties of the Peninsula with significant production also in Hardee, Hillsborough, and Manatee counties, as well as in the Panhandle. Both fresh use and processing blueberries are produced.

CABBAGE 1991-92

Cabbage growers in Florida produced 5.1 million crates and bags of cabbage during the 1991-92 season, down 11 percent from the previous season. The gross value of sales was \$27.7 million, down three percent from a year earlier. This reflects a nine percent increase in the season average price from \$5.03 the previous year to \$5.46 in 1991-92.

was the leading cabbage producing county with 3,900 acres.

Planted acreage totaled 11,600 acres, down 1,100 acres from a year earlier and continuing a trend that started in the mid 80s. Harvested acreage amounted to 10,800 acres, down 1,150 acres from the previous year and the lowest since the 1941-42 season. The average yield of 470 crates per acre was down eight crates from the previous year.

Planting was underway by mid-September in the central areas and by late September in the Hastings area. By early October, planting was underway in most other production areas. The fall growing season was generally conducive to good growth and development.

The combined East and West Central areas led the State in production. This area accounted for 46 percent of the State's production during the 1991-92 season. Manatee County, for the fourth consecutive year,

Cutting was underway by the first week in December with a good volume available by late December. Some fields were damaged by freezing temperatures in mid-January. Harvest continued after the frost, but available supplies were down slightly. Shipments increased in February with the largest number just prior to St. Patrick's Day, which is usual. Rains in April lowered the quality in some areas. Harvest was active through April, fell off rapidly during May, and ended in early June.

SWEET CORN 1991-92

Production of sweet corn reached 11,572,000 (42-pound crates) in 1991-92. The yield was 231 crates per acre, down from 249 crates per acre the previous year. The harvested area was 50,100 acres, up from 48,200 acres in 1990-91. The value of production was \$76,062,000, down from the record high the previous year of \$94,074,000.

The price per crate averaged \$6.57, peaking in March at \$11.84 and dropping to \$4.49 in June.

Over 50 percent of the production came from the Everglades area. The central production area around Zellwood produced 24 percent of the State's production.

Planting of the fall crop was complete in the northern areas by late August and harvest started there

in late September. Harvesting began in the Zellwood area in early October and in the Everglades in late October. The fall harvest moved down the Peninsula to the Homestead area by December. The winter harvest season began in the East Coast area in Dade County in mid-January. Picking of the spring crop started in the Everglades area in mid-March and in Zellwood in early May. The harvest was completed in the north in late June.

Inclement weather negatively affected the crop on only a few occasions. Planting was delayed somewhat in the East Coast area in the fall and gusty winds in December lowered the crop condition in Dade and the East Coast. In late March, hail did limited damage to the Everglades and Zellwood crops.

CUCUMBERS 1991-92

Production of cucumbers in Florida during 1991-92 reached a record high 8.9 million bushels, up 19 percent from the previous record of 7.5 million bushels picked during the 1990-91 season. Increases from a year earlier of 2,550 fresh market acres harvested and 700 acres for the processing or pickle market caused the expansion of production since no change occurred in either the fresh or the processed cucumber yield per acre. Growers harvested 16,500 acres of fresh market cucumbers, and 2,500 acres for pickles. Fresh market production, valued at \$79.6 million, set a new record high for the sixth consecutive year, and was one percent above the previous record high set last season. Value of the 1991-92 pickle crop totalled \$7.4 million, up 42 percent from a year earlier. The season average price, at a record high \$11.56 per bushel, surpassed the previous record high of \$11.28 set last season.

Southeastern growers harvested 35 percent of the State's acreage, surpassing the Southwest as the leading production area for the second consecutive season. The Southwest and the West Central areas each accounted for 28 percent of the harvested acreage. Acreage in the western Panhandle and northern areas accounted for the balance.

Southwest and Southeast growers started fall crop plantings during early September, while planting became more active in central regions. Wet weather delayed some Dade County plantings around mid-September. Mild weather during September kept north Florida acreage in good condition. The northern and central area harvest was underway in late September as Dade County plantings started. Limited harvest began in the Southeastern area, and wet soils delayed some Southwestern land preparations during early October. Rain during the first part of October benefitted plant growth and fruit development in Dade County. Light picking started in the Southwest after mid-October.

Northern growers finished harvesting and Dade County producers picked the first pickles in early November. Cool temperatures slowed Dade County cucumber growth around mid-November. The fall crop harvest in the Southeast was limited to scrapping during late November. Dade County growers suspended planting by early December. Central producers marketed only a limited volume around mid-December with harvest completed during late month. Strong wind during late December tossed some Southeast and Dade County plants that had no wind break protection. Southwestern growers began spring crop planting in early January. Freeze covers in the Southeast protected plants from late January low temperatures. However, the cold weather slowed germination and lowered cucumber condition in unprotected Southwest area fields. During early February, gusty winds tossed vines while cool temperatures lowered cucumber condition in the Southeast. Dade County growers completed the spring crop planting and winter crop harvest, while central area producers began spring crop planting in early February. Rain falling over Southeastern areas before mid-February stopped the need for overhead irrigation. Cool temperatures during mid-February slowed fruit development in Dade County fields. Southwestern producers finished spring crop planting, and both Southeastern and Southwestern growers began the spring crop harvest in early March. Cool temperatures during mid-March slowed plant growth and fruit development in the Southwest. Strong wind during late March reduced cucumber condition in some southeastern fields. Central growers began the spring crop harvest in late March. Around mid-April, strong wind caused minimal damage to Southeastern cucumbers. Hot, dry weather and strong wind in Dade County affected cucumber development from early to mid-May. Harvest increased seasonally during late May in the North. Picking ceased in all but the North area by early June.

EGGPLANT 1991-92

Eggplant production during the 1991-92 season reached a record high 2,184,000 bushels, 39 percent higher than the 1990-91 production of 1,571,000 bushels, and 30 percent above the previous record crop of 1,679,000 bushels produced during the 1979-80 season. An expansion in acreage harvested and a record high yield per acre caused the increase in production. Growers harvested 2,550 acres in 1991-92, compared with 1,950 acres the previous year, and 2,800 acres in 1979-80. Yield averaged a record high 856 bushels per acre during 1991-92, fifty bushels above the 1990-91 yield, and 41 bushels above the previous record high yield of 815 bushels per acre averaged during the 1989-90 season. The 1979-80 yield averaged 600 bushels per acre.

Value of the 1991-92 crop reached a record high \$16.9 million, 30 percent above the 1990-91 value of \$12.9 million, and 25 percent higher than the previous record high value of \$13.5 million for the 1989-90 crop. The average value per bushel at \$7.73 is the third highest of record and compares with the second highest of \$8.26 for the 1990-91 crop, and the record high \$8.52 averaged during the 1989-90 season. Weak fall crop prices gave way to stronger prices for the winter and spring months of February through May when 45 percent of the crop sold for prices that averaged from about \$10 to almost \$12 dollars per bushel.

The southeastern area, primarily near the cities of Pompano, Delray, and Lake Worth, accounted for 65 percent of the 1991-92 production versus 56 percent of the previous season's crop. Production in southwestern counties, representing 16 percent of the 1991-92 total, more than tripled from the previous year. The northern and central areas accounted for the remaining crop. Producers in the western, northern, and

central areas harvest only fall and spring crops because the possibility of freezing weather is too great during the winter months.

Warm, rainy weather boosted growth and development of southeastern transplantings during August and September. First sales from northern Italian cuttings started in mid-September. Producers in southeast coastal counties began cutting regular and Italian varieties as Dade County growers started winter crop transplantings in late September. Mostly warm conditions during October aided development of the southern crop. Northern producers finished cutting the fall crop in early November. Dade County growers made the first cuts around mid-November. Southwestern producers began to market a limited volume by early December. Sand blown by strong winds during December damaged some plants and scarred some young fruit in southeastern and Dade County fields not protected by wind breaks. Cool temperatures during January retarded growth of some southern acreage. Southwestern growers transplanted a limited spring crop acreage during early February, while rain interrupted some cutting along the southeastern coast. Strong winds in both early and late February lowered condition of some Dade County fields. Some southern growers mowed oldest fields with expectations of a second or sucker crop sprouting for spring harvest. Cool temperatures during March slowed blooming, fruit setting, and fruit sizing. Warmer weather in April advanced development of the southern crop. Central area growers began cutting the spring crop by late April. Dade County producers cut some of the sucker crop in mid-May with all harvesting finished by late month. Growers completed the southwestern harvest by early June. Producers finished cutting the southeastern crop in mid-June. Northern growers provided a light, steady volume through early July.

ESCAROLE-ENDIVE 1991-92

Escarole production in 1991-92 reached 1,584,000 crates, down slightly from the previous year's 1,650,000 crates. A crate of escarole equals 25 pounds. It was the fourth consecutive decrease in annual production.

The price per crate was \$4.69 for the season, down from the 10-year record high the year before of

\$6.44 per crate. The total value of the 1991-92 crop was \$7,425,000.

Florida escarole and endive is produced mainly in two areas of muck soils, the Central area northeast of Lake Apopka, and the Everglades area south of Lake Okeechobee. Production was fairly steady from November through April, before tailing off in May.

LETTUCE 1991-92

There were 8,400 acres of head, leaf, and romaine lettuce harvested in Florida in the 1991-92 season in two muck soil production areas. There were 7,600 acres (90 percent) grown in the Everglades area, with the balance in the Central area. Sarasota and Lake Placid mucklands contribute light supplies during much of the season. Iceberg lettuce is grown almost exclusively in the Everglades area.

The average yield per acre was 177 cwt, slightly below the previous 5-year average yield of 186 cwt. The value of all lettuce produced in Florida in 1991-92 was \$22,599,000, the fourth year in a row that the total value of lettuce declined. Total production was 1,488,000 cwt, up seven percent from 1990-91.

The average annual price of head lettuce was \$15.24 per cwt. (Head lettuce includes iceberg, boston, and bibb lettuces.) The average price per cwt for leaf lettuce was \$15.17. Romaine lettuce averaged \$14.83 per cwt.

The growing season for lettuce started in September and the initial harvest of specialty types was underway in the Everglades in late October. Harvest of iceberg lettuce started in early December in the Everglades. The shipment of lettuce peaked in late December and again in mid-April. Shipment of significant quantities was complete by mid-May. The growing season weather for lettuce was uneventful.

PEPPERS 1991-92

The 1991-92 Bell pepper crop production of 18.8 million bushels picked set a new record high and was 31 percent higher than the previous record 1990-91 production of 14.4 million bushels, which included a small amount of specialty peppers. The continued increase in the use of improved varieties brought the 1991-92 yield to a record 912 bushels per acre, up 194 bushels from last year's average. Acreage harvested at 20,600 acres showed a 600 acre increase from the previous season. All production regions established an increase in harvested acreage except for the Southwest. Growers in the southwestern counties had a slight decrease of 700 acres in acreage harvested, but continued as the State's leader with 7.8 million bushels produced. Southeastern producers marketed 6.7 million bushels, a 52 percent increase from the 4.4 million bushels harvested during the 1990-91 season, caused by both a 12 percent increase in acres harvested and a 35 percent increase in yield. The f.o.b. price of \$9.09 per bushel average during the 1991-92 season was \$3.00 below a year earlier with all months except January, February, and March showing lower prices than those averaged during the previous year. Total value of the crop was placed at \$170.8 million, the second highest of record, and about two percent below the 1990-91 record high value of \$173.6 million.

Rains during early September caused some planting delays in southern areas, but aided plant growth and fruit development in fields planted earlier. Producers reset plants with low recovery prospects to assure good stands and adequate plant populations. Northern growers began harvest in late September, while

southeastern producers started in early October. Picking in the Southwest and West Central production areas commenced during late October. Northern producers completed the fall crop harvest in early November. Cooler, drier weather during November aided growth and development in southern fields. Heavy rainfall in early December reduced the condition of some southeastern fields. Strong winds over southern areas in late December caused some leaf burn and tossed younger plants. Growers again reset plants heavily damaged. West Central producers finished most fall crop picking in late December with some fields scrapped during early January. The Dade County harvest of a limited acreage became active in late January. Southeastern growers placed freeze covers over fields in late January to diminish damage from cold temperatures. Cooler temperatures slowed growth in some southern fields during late January and early February. West Central spring crop plantings became active by early February as southwestern growers wound down transplanting. Planting and picking slowed during late February due to heavy rainfall in most southern areas. The southern spring crop harvest gained momentum during March. Cool temperatures in early to mid-April slowed the growth of some West Central acreage with producers starting the spring crop harvest after mid-month. The Dade County harvest continued throughout April. The southern spring crop harvest reached peak level during April and May with southwestern and southeastern picking finished by early June. Northern growers began picking the spring crop by mid-June with limited volume available from the West Central area throughout the month.

POTATOES 1991-92

Potato production in Florida during 1992, including both winter and spring, totaled 9.4 million cwt. This was 16 percent more than the 1991 crop. A total of 41,200 acres were planted for harvest in 1992, six percent less than the previous year. Out of this total, 40,100 acres were dug, seven percent less than 1991. The value of the crop was placed at \$92.9 million, down 44 percent from last year's record high. The price received for all potatoes averaged \$10.00 per cwt compared with \$20.40 in 1991. The yield for all potatoes was 234 cwt per acre, up 46 cwt from the previous year.

The first winter potatoes were planted in the southwest area around mid-October. Planting in Dade County started after mid-October and ended in early January. Harvest started in the southwest in late January and was completed by late April. In Dade County, harvest was started by mid-February and was completed by mid-May.

At Hastings, the largest spring growing area, planting was underway by the end of the first week of January and was active through the first week of March. The crop made it through February and March with only minor leaf burn from frosts. Harvest in the Hastings area started in mid-April and was active through early June.

In the other spring areas, planting started in late November and continued into March. Harvest started in mid-March and continued into mid-June.

The "red-skinned" varieties are the dominant potato grown for winter harvest in south Florida. Most of the winter crop is sold for table stock. In the Hastings and other spring areas, the "white-skinned" varieties dominate. Most of this production goes to the potato chip industry. The Hastings production is used to produce the Memorial Day chips!

SQUASH 1991-92

Harvested area of squash in the 1991-92 season reached 12,500 acres, up six percent from the previous year. Production was a record high at 4,300,000 bushels. (A bushel of squash equals 50 pounds.) Yield was also a record high at 344 bushels per acre. Shipments of squash had two peaks, the highest in March, and another in January.

The price per bushel was \$7.50 as the season began in October and peaked at \$14.90 in March. The price fell to \$4.30 per bushel as the season ended in June. Total value of the crop was \$45,975,000, the second highest level in 15 years.

Florida produces acorn, butternut, yellow crook-neck, yellow straightneck, white, and zucchini squash. Dade County accounts for 39 percent of the State's production, and the balance of production is distributed fairly evenly in the North, North Central, West Central, and Southwest production areas.

The harvest of squash started in mid-September, one of the earliest crops of the season. Planting of the fall crop was active in September in the other major production areas of the State. The fall harvest finished in the north in early November, while harvesting moved to the southern areas through December. From January through March, planting and harvesting continued steady in the southern production areas. Planting was completed in the southern areas by late April, while harvesting continued. Harvesting activity moved to the north by the end of June when the season ended.

Inclement weather had a minor role in the 1991-92 squash season. Minor flood damage occurred in Dade in late September and quality of some fruit of the East Coast area was reduced in mid-October by rain.

RADISHES

1991-92

Harvested acreage of Florida radishes was 22,800 acres, down from 25,000 acres the previous year and the smallest acreage in 10 years. The yield per acre was 269 cartons, slightly above the previous 5-year acreage of 254 cartons per acre. (A carton of radishes is 15 pounds.)

The average season value per carton was \$3.52, below the previous 5-year average of \$3.70 and down significantly from the previous year record high price of

\$4.95 per carton. The value of the total crop was \$21,578,000.

Growers were preparing land and seeding in early September in the North Central area and in the Everglades. Harvesting got underway in early October. Planting and harvesting continued on schedule for the remainder of the growing season. The last of the crop was dug in mid-June.

STRAWBERRIES

1991-92

Production of strawberries reached 11,705,000 flats in 1991-92 season, a record high. Area harvested was 4,700 acres, down 15 percent from the previous year. The yield, at 2,500 flats per acre, was also a record. (A flat of strawberries equals 12 pounds.)

The value of the strawberry crop was \$94,752,000, up 12 percent from the 1990-91 crop value. The value per flat averaged \$8.067, the highest average yearly price in 15 years. The price per flat as the season started in December was \$11.26 and the prices declined to \$4.92 as the season ended in April.

The major production area is in northeastern Hillsborough County. A significant amount of U-Pic acreage is grown in Dade County and the East Coast production area.

Transplanting was active in the West Central area in late September and U-Pic fields were being planted in Dade County and the East Coast area in mid-October. Commercial picking began in early November. U-Pic harvesting began in Dade County and the East Coast in mid-December. Harvesting peaked in the West Central area in mid-March. The West Central fields were switched to U-Pic in early April as the commercial season declined. The U-Pic season was complete in the southern areas in late April, and in the West Central area a month later.

Unusual weather in mid-January had growers using overhead irrigation to minimize damage from cold weather. Berry development was somewhat slowed by cool weather in the southern areas in early February. Rain slowed picking in the southern areas in mid-February and early March.

TOMATOES 1991-92

The value of the 1991-92 Florida tomato crop for fresh market and processing increased to a record high \$728.6 million, 26 percent higher than the 1990-91 value, and six percent higher than the previous record value of \$687.9 million attained for the 1988-89 crop. A 900 acre increase in harvested acreage combined with a record high yield of 1,587 cartons per acre to produce a record high crop of 81.4 million cartons for fresh market sales, 30 percent above the previous year, and seven percent above the previous record fresh market production of 76.3 million cartons attained for the 1987-88 crop. The record high fresh market yield compares with 1,239 cartons per acre last year, and the previous record high of 1,344 cartons during the 1987-88 season. Growers received an average of \$8.95 per carton, f.o.b. basis, for the 1991-92 crop, the third highest price on record. This compares with the highest price of \$9.37 per carton for the 1988-89 season, and the second highest price of \$9.23 per carton for the 1990-91 crop. Weak market conditions in late November and all of December caused the producers' marketing order to impose restrictions on the sizes and grades shipped, with most growers complying. The January, February, and March prices increased to at or near the record high level for each month. However, spring prices again dipped to season lows at levels not seen since the spring of 1985 and 1986.

Tomatoes used for fresh production accounted for 99 percent of total 1991-92 production while processing tomatoes made up the remaining one percent. Southwestern growers accounted for 40 percent of total fresh production compared with 41 percent the previous season. Twenty-eight percent of production came for the Palmetto-Ruskin area versus 25 percent in 1990-91. Dade County producers made up 13 percent of production in both 1991-92 and 1990-91. The East Coast produced 12 percent of the 1991-92 crop versus 11 percent the previous year. Production from the northern Peninsula dropped to seven percent of the 1991-92 crop versus ten percent of the 1990-91 production.

Northern growers started transplanting about mid-July, while southern producers began transplanting during early August. Heavy showers during late August and early September delayed some ground preparations and transplanting, and washed down some beds in southern localities. Dade County growers began planting about mid-to-late September.

WATERMELONS 1991-92

Watermelon acreage planted during the 1991-92 season totaled 53,000 acres, a 15 percent increase from 1990-91 plantings. Of the total acreage planted, 45,000 were harvested, a 25 percent increase from the previous year. Production at 9.0 million cwt was 28 percent above a year earlier and reflects the increased acreage and yield. Yields averaged 200 cwt per acre during the season compared to 195 cwt for the year prior. Yields varied from 145 cwt in the West production area to 210 cwt in Central production area.

A small acreage of fall watermelons is grown in the south and scattered central areas. These melons are harvested in November and December depending on weather conditions. This acreage and production is included in the spring crop.

Land preparation started in December in the southwest. Light planting was underway by the end of December. By

Palmetto-Ruskin producers had all fall crop acreage in the ground by late September. The northern harvest started in late September. Rainfall again hampered southern field preparation during early and late October. Fresh market picking began in southwestern and Palmetto-Ruskin fields around mid-October, while southeastern producers started harvest later in the month. During early November frosty temperatures arrived in northern areas as growers completed the fresh market harvest. Strong wind blowing during early November burned some young plant leaves in the southern localities. Cool temperatures during most of November slowed fruit sizing with some scheduled picks delayed about a week. Dry, windy conditions during November in Dade County prompted growers to increase the frequency of irrigation. Above normal temperatures during most of December boosted the development of tomatoes in all southern production regions. Producers finished picking most Palmetto-Ruskin fields by the end of year holidays. Strong, gusty winds buffeted most acreage in late December with some young plants without stakes damaged, and some blooms and small fruit dropping from older plants. Palmetto-Ruskin growers started spring crop transplanting in early January. Light breezes kept frost at bay during a cold snap during the last half of January. However, below normal temperatures for most of January retarded some plant growth and fruit development. Warmer temperatures during February advanced some blooming and fruit setting up to two weeks ahead of schedule. Excessive winds caused limited damage to some southern acreage in early February. Abundant rain during late February and early March curtailed some field activity. Spring crop transplanting in northern areas was in full swing during March with growers finishing up in early April. The northern fields escaped frost damage as temperatures plunged during early April. The Palmetto-Ruskin spring crop harvest started after mid-April. A weak market again curtailed some third picks and the harvest of marginal fields during late April. Cool temperatures during early May slowed the development of the northern crop. Dade County growers finished commercial harvesting by mid-May. A sluggish market curtailed Palmetto-Ruskin picking during late May. Southwestern producers finished the harvest of mature green tomatoes in late May. The Palmetto-Ruskin harvest continued through late June. Northern growers began picking in early June with activity continuing through early July.

mid-January, planting was in full swing in the Southwest and was getting underway in the West Central area. Growers in the northern and western areas were planting by March 1. Scattered frost in lower areas on April 4 necessitated some replanting of lost acreage. Cool temperatures in late March and April slowed plant development.

Harvesting was underway in the southwest by mid-April. In the West Central area some cutting was underway by late April. Harvest was underway in the northern and western areas by the end of May. Harvest was winding down in the southwest by June 1 and in the West Central by mid-June. Commercial production in the northern and western areas dropped off rapidly after the first week of July and was complete by the end of July.

OTHER CROPS

1991-92

Cantaloupes are grown in Florida primarily in the spring and summer in the Southwest and North Central areas. Some cantaloupes also are grown during the fall months in the Southwest and West Central areas. The peak harvest period is normally May and June. Much of the production is sold through roadside stands and local markets. This minor crop is not included in the survey program for vegetable and melon statistics. No shipment data is available.

Cauliflower is grown in the North Central and West Central areas. Harvested acreage in 1991-92 was up slightly from a year earlier. Supplies are available from late November through early May. At the present time, statistics are not available for publication. Shipment information is recorded by the Market News Service. In the 1991-92 season, there were 33.7 thousand hundredweight (135 thousand 25-pound cartons) shipped out of the State. This was down slightly from shipments of 34.8 thousand hundredweight the previous year.

Tropical vegetable production during the 1991-92 season was up from the previous year. By far the majority of the acreage is grown in Dade County. The Dade County Agricultural Extension Service reported 14,130 acres of tropical vegetables planted in the 1991 calendar year. (No data yet available for 1992 acreage.) Available land continues to be a limiting factor for all agricultural production in Dade County. Peak production of malanga occurs in February through April. Efforts are being made to provide more even supplies throughout the year. Miami and the Tampa Bay areas are important points of consumption for the Florida production. The supplies shipped out of State are primarily for the New York City and Philadelphia areas.

"Tropical vegetables" is a colloquial expression applied to certain vegetables primarily of Latin American and Caribbean origin. The most common tropical vegetables, followed by the scientific name, are listed below. (Other common terms for various vegetables are shown in parentheses). The crops are: boniato-*Ipomea batata* (sweet potato); calabaza-*Cucurbita* (pumpkin); malanga-*Xanthosoma caracu* or *Coclocasia esculenta* (dasheen, yautia); and cassava-*Manihot esculenta* (crantz, yucca, tapioca). Boniato, calabaza, and malanga constitute the bulk of production.

Collard, turnip, mustard, and other greens are grown throughout the State and centered around large population areas and in the muck soils of the Everglades and Zellwood areas. In 1991-92, a fair

volume was available from December through April, with the final shipments made in early May. Shipments totaled 50 thousand hundredweight during the 1991-92 season, up 44 percent from a year earlier.

Okra is grown in many areas of the State, however, Dade County produces okra for local use as well as for shipments to other States. Peak production was in May and June with a good supply in October and November. Shipments of out-of-State markets during the 1991-92 season totaled 167 thousand hundredweight.

Green onions and leeks are produced in the North Central and West Central areas. Supplies are marketed primarily at roadside stands and markets for local use, but there are several large producers who ship to other States.

Supplies of **dry onions** are limited. Most of the dry onions are produced in southern and west central areas of the State. Dry onion shipments totaled 36 thousand 20-pound sacks during the 1991-92 season.

Parsley is available in both the curly and plain types. The bulk of the commercial volume shipped to other States is produced in the Everglades and Zellwood areas. Light supplies sold for local use are available from Sarasota, Lake Placid, and other areas. Shipments to out of State markets totaled 92.1 thousand hundredweight (438 thousand 21-pound cartons). Most of the shipments occurred from December through May.

Southern peas are grown primarily in the West, North, West Central, and Everglades areas of Florida. Dade County also produces a considerable amount of southern peas. Light supplies are generally available from September through December. Heavy movement is spread out from November through May. A high percentage of the crop is utilized for processing. Good supplies are sold through local markets for fresh use. Market News Service shipment statistics for out-of-State markets show 18 thousand hundredweight for fresh market during the 1991-92 season, up seven percent from the previous year.

Watercress is available throughout the year. The major source of supply is the Fellsmere area. Most of the production is shipped to northern and eastern markets in the United States. A limited supply is available from local State farmers' markets, especially the Sanford market. No shipment data is available.
