1/ The base period associated with each index year is a five-year moving average, i.e. 2007 base = 2001-2005.

Note: The Illinois prices received index has been computed from 1956 to the present using new quantity weights each year. The index utilizes weights based on the average value and quantity of each commodity sold during a previous five year period. The current year's base is computed by multiplying the average production for the five year period by the average price for each year. These five years are summed and then divided by five to arrive at an average for the period. The five-year average production is multiplied by the current price and then divided by the average for the five years to arrive at the current index.
