INDIANA CROP SUMMARY FOR 1936

Wheat was seeded on 1,880,00 acres in the fall of 1935. This was a reduction of three per cent from the acreage seeded in 1934. Condition of the crop on December 1 was 84 per cent of normal; in 1934, wheat condition was 85; ten year (1923-32) average was 85.

The winter was severe and the injury from freezing and heaving was serious. The condition of the crop on April 1 was reported as 69, a decline of 15 points since December. The average decline between these two dates is 11 points. Wheat was slow in starting. Abandonment was estimated at 6.0 per cent, leaving 1,767,000 acres for harvest. No doubt many thin stands were allowed to remain because of the new clover which it might protect. Spring floods killed some wheat. Some wheat land was sown to oats.

The dry open spring and early summer favored the development of the crop. Many thin stands were harvested, but the heads had filled well. Hessian fly caused some damage locally. In general, wheat harvesting was done under most favorable conditions. Quality and test were above average. All sections reported wheat yielding better than expected. A state yield of 17.5 bushels per acre producing 30,922,000 bushels is the estimate.

Rye was seeded on 179,000 acres in 1935. This was 55 per cent of the area which was seeded in 1934. The condition of the crop on December 1 was reported as 86 per cent of normal; the ten year (1923-32) average is 88.

A large per cent of the Indiana rye sown is used for purposes other than grain. During the last three years, 36, 44 and 45 per cent respectively of the area sown has been used for these other purposes.

The dry open weather of early summer which favored the outcome of the wheat crop also favored rye although to not such a great extent since more of this crop is grown on light land. A state yield of 12.0 bushels per acre making a total production for the state of 1,188,000 bushels is estimated.

Corn prices during the winter (October to April) of 1935-36 averaged 51.4 cents a bushel compared to 77.6 cents a bushel average for the same months the previous winter. Price by months varied from 45 to 74 cents; the winter before from 70 to 83.

The preparation of corn land for planting in 1936 was begun under favorable circumstances. The prolonged dry weather of late spring and early summer prevented much of this land from being worked down to a proper seed bed. Many fields intended for corn had not been planted by July 1.

Light rains helped bring fair stands in some localities. In many cases, fields had to be replanted.

On July 1, condition of the crop was reported as 73, only 3 points below the ten year (1923-32) average. Corn was clean and well cultivated. Unevenness in size of the plants was common in all sections. Stands were imperfect due partly to insect damage and partly to poor seed germination. Corn was rooting deeply though top growth was slow.

By August 1, corn condition had fallen to 46, 29 points below the ten year (1923-32) average for that month. Much of the early corn in all sections of the state was beyond help at this time. The condition of late corn was spotted, due to local rains. Intense heat during August ripened some corn immaturely. By September 1, corn was still uneven in size but eared very well considering the adverse season. During September, condition improved 7 points more than average. Most of the corn was beyond frost damage by October 1. During corn harvest, great variations in yields were reported, even in the same county. A state yield of 25.5 bushels per acre with a total state production of 115,413,000 bushels is estimated.

Oats seeded in the spring of 1936 totaled 1,485,000 acres, or 7.6 per cent less than the acreage seeded in 1935. An estimated 4.0 was

abandoned or used for purposes other than grain. Dry weather continuing from early spring caused many poor stands.

On June 1, condition of the crop was 73 or 4 points below the ten year (1923-32) average. The crop was short, stands were thin and the development of the crop was being delayed by dry weather.

By July 1, condition had fallen 19 points below June 1; the usual decline is 1 point. Much straw was too short to bind. Many fields were pastured. This was partly due to short straw and poor grain and partly to meet requirements of the Soil Conservation Program. Better grain in this short straw than was expected, caused some of the mowed oats to be threshed.

The oats harvest was from one to two weeks early. Quality of the grain was reported to be uneven but the condition for feed and storage, excellent. A state yield of 27.0 bushels and a total production of 38,502,000 bushels is the estimate.

Barley was harvested from an estimated 20,000 acres in 1936. Winter barley is increasing in acreage in the southwestern district of the state. The hot, dry weather during the growing season injured this crop much as it did oats. A state yield of 19.0 bushels per acre or 2.7 bushels below the ten year (1923-32) average is estimated.

Buckwheat was harvested from an estimated 8,000 acres in 1936 compared to 28,000 acres in 1935. The state yield per acre was 13.0 bushels compared to 14.0 bushels a year ago. Seeding of the crop was done under unfavorable conditions and the dry weather retarded its development. Straw was short. By September 1, much of the crop was only in full bloom.

Hay meadows were given a slow and late start by the cool, dry weather of April. A good first cutting of alfalfa was harvested, but the continued dry weather in addition to the heat, made a lighter than usual clover crop.

Tame hay was harvested from 30,000 less acres than in 1935. An increase of 100,000 acres of clover and timothy was practically offset by a decrease in soybean and cowpea hay. Alfalfa acres remained the same. All kinds of tame hay yielded less than in 1935 or the ten year (1923-32) average.

Soybeans grown alone decreased from 850,000 acres in 1935 to 706,000 acres in 1936. Acres harvested for beans decreased from 410,000 acres to 282,000 acres. Yield per acre was 14.0 bushels; in 1935, 17.0 bushels. The dry cloudy land made seeding of the main crop a difficult job. Many thin or poor stands were secured. Although the crop withstood the drought of early summer in good shape, the growth was uneven, depending on local showers. With other tame hays producing a light crop and many soybean fields giving a poor promise of a grain yield, there was a tendency to use a larger proportion for hay than usual. Fall rains coming before the beans could be harvested for grain made many weedy fields as the soybean plants were too far along to benefit much from the extra moisture. Cowpeas were raised on a smaller acreage than in 1935. That part of the crop harvested for peas yielded 8.0 bushels per acre compared to a yield of 11.0 bushels in 1935.

Potatoes were harvested on 57,000 acres in 1936 compared to 81,000 acres in 1935. Yield per acre was 81 bushels per acre or slightly higher than a year ago. Potato planting was done in good season but the continuing dry weather ruined much of the early crop. By July 1, the condition of this early crop was reported from low in condition to a complete failure. The late plantings had so little rains, poor stands resulted. The muck areas of the northern part of the state in September and October reported potatoes in much better condition than in other sections and were largely responsible for the fairly good state yield.

Sweet potatoes were harvested on 4,000 acres instead of 5,000 as in 1935. Yield per acre was 80.0 bushels compared to 85.0 in 1935. Much of the state's sweet potato acreage is in the southwestern corner and did not benefit from late July rains as did nearby areas. The favorable

weather later in the fall did much to improve the condition of the crop and to increase its yield.

Tobacco was grown on 6,400 acres or 1,200 acres less than in 1935. There was much difficulty in securing stands. Even with the best cultivation, the land gradually dried out. Plants were short. Yields were reported from almost nothing up to average. A state yield of 700 pounds an acre is estimated. Last year's estimated yield was 866 pounds per acre.

Apples were injured by the severe winter and spring frosts. Light blooming was reported. Hail damaged apples in the south during July. By August 1, dry weather had caused a heavy apple drop and reduced the size of the fruit remaining on trees. After the fall rains, especially in the northern part of the state, apples sized up well. The total state production was larger than at first expected. The estimated production is 487,000 bushels or a little over one-fourth of the production a year ago.

A large percentage of the state's peach trees was entirely killed by the severe winter. Spring frosts killed most of the buds remaining. The three northern districts reported the least injury, and these same districts reported the best condition of the crop during the whole season. A production of 12,000 bushels is estimated for the state.

Pear production was estimated at 56,000 bushels. This was practically one-third of the estimate for 1935. Pears were also reported in much better condition in the three northern districts. Generally, pears withstood the dry weather well.

Production of grapes was estimated at 1,700 tons. Last year 2,849 tons were produced. During the early part of the season, grapes were reported uniformly good compared to other fruits. The continued drought burned leaves and prevented good sizing of the fruit. September rains in the north which were more than normal, did much to help improve the grape crop.

Onions were harvested on 3,400 acres and yielded 210 sacks per acre. This compares to 4,900 acres yielding 110 sacks an acre in 1935. Stands were thinned in most sections by wind, cool weather and cut worms. Wind in early summer even caused some acreage abandonment. In spite of dry weather and extreme heat during mid-summer, the onion crop was able to continue its development and benefit from the fall rains. Thrip was not as serious as last year.

Winter wheat seeded in the fall of 1936 is estimated at 2,300,000 acres, 122 per cent of the area seeded in 1935.

Wheat seeding was delayed over much of the state; some land prepared for wheat was never seeded. The reported condition on December 1 was 82 per cent of normal. Top growth was small and only fair in appearance.

Rye for all purposes was seeded on 340,000 acres, 190 per cent of the 1935 seeding. Condition on December 1 was reported to be 88 per cent of normal. Rye seeding was also delayed by the heavy fall rains.

The data in the following tables were published originally in Purdue University Agricultural Experiment Station Bulletin No. 320, "Prices of Farm Products in Indiana." According to the plan presented in this bulletin the data will be brought up to date and published annually in "Indiana Crops and Livestock." A copy of the original publication may be obtained from the Experiment Station.

TABLE XII—INDIANA INDEX NUMBER OF FARM PRICES

Based on Indiana farm prices for 17 products on the fifteenth of each month (1910 to 1914=100)

YEAR	Jan.	Feb.	Mar.	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Yearly Average
1910.....	107	107	112	110	106	104	102	99	104	100	95	93	103
1911.....	93	89	86	83	81	82	86	92	95	91	90	91	88
1912.....	94	96	97	104	106	104	100	100	102	102	96	95	100

*The index of prices paid by farmers is reported by years from 1910 to 1922, inclusive, by quarters from March, 1923 to June, 1933, and monthly thereafter. The monthly figures used for the early years were obtained by interpolating between the quarterly or annual figures.

ANNUAL LIVESTOCK SUMMARY

1936

**DEPARTMENT OF AGRICULTURAL STATISTICS
WEST LAFAYETTE, INDIANA**

LIVESTOCK SUMMARY, INDIANA, JANUARY 1, 1936

The estimated number of livestock on Indiana farms January 1, 1936, showed decreases in horses, mules, milk cows and milk heifers and increases in all cattle, swine, stock sheep and lambs on feed since January 1, 1935. The same comparison for the United States showed decreases in all classes except swine.

The estimated changes in numbers for Indiana and the United States shown as percentages are as follows: horses decreased in Indiana 1.0 per cent, in the United States, 1.9 per cent; mules decreased in Indiana 1.0 per cent, in the United States, 2.8 per cent; milk cows decreased in Indiana 4.0 per cent, in the United States, 2.4 per cent; all cattle increased in Indiana 5.0 per cent, decreased in the United States, .5 per cent; swine increased in Indiana 10.0 per cent, in the United States, 9.1 per cent; stock sheep and lambs increased in Indiana 2.0 per cent, decreased in the United States, .6 per cent and feeder lambs increased in Indiana 14.7 per cent and decreased in the United States 5.4 per cent.

This is the second time in the last ten years that milk cows in Indiana have shown a decrease from the preceding January.

In both Indiana and the United States, the value per head and the total value was greater for all classes of livestock than on January 1, 1935.

The percentage of all cows being milked on reporters' farms in 1935 showed increases during 8 months, decreases in 3 and the same percentage during the remaining month. The production per cow milked showed increases for all months except January, February, September, October and November. In February, production was the same. Production per farm was greater from March to August inclusive and less during all other months. This would indicate that the better pastures of 1935 were largely responsible for the increase. During the months of dry feeding, apparently little grain was fed other outlets for grain making a stronger bid for the available supply.

Higher butter prices during every month of the year except August, in which month the price was the same, encouraged the milking of low producing cows or the continuing of those already in milk through a longer lactation period.

The reduction in milk cows is the largest ever made in the state since records are available, but still leaves a larger number than for any year up to and including 1932. There had been a steady increase from 1926 until 1934. While milk heifers also showed a decrease, there are still more on Indiana farms than in any year previous to 1930.

Sales of cattle and calves from Indiana at the principal stockyards showed a one per cent increase over 1934. The average price of milk cows increased from \$31.00 to \$49.00 and the per head value of all cattle from \$24.60 to \$38.40.

Hog numbers were 10 per cent greater than on January 1, 1935. Spring farrowings were estimated to be 88 per cent and fall farrowings 116 per cent of the respective farrowings of 1934. Sows to farrow in the spring of 1936 were estimated to be 119 of the number farrowing in the spring of 1935.

Receipts of Indiana hogs at the principal stockyards in 1935 were 71 per cent of those in 1934. The average value per head of hogs on farms increased from \$6.40 to \$13.50.

Indiana sheep increased in number for the second successive year while sheep in the United States were showing decreases both years. This increase in Indiana was 2.0 per cent for stock sheep and lambs and 14.7 per cent for feeders. 515,000 ewes produced 574,000 lambs, a 112 per cent lamb crop or a 5 per cent better crop than in 1934.

The estimated number of sheep shorn in 1935 was 642,000 head; in 1934, 640,000. The wool clip for the state was 4,943,000; in 1934, 4,800,000 pounds. The average fleece weighed 7.7 pounds in 1935; 7.5 pounds in 1934. Wool prices for the first 10 months of 1935 were from 1 to 10 cents less than for the corresponding months of 1934. The November price was the same, and December showed a gain of 3 cents a pound.

Sheep sold from Indiana at the principal stockyards were 15 per cent more in numbers than in 1934. The average value of stock sheep and lambs on farms increased from \$4.83 to \$6.34.
