

# Apples

Apples are the major fruit in Washington. Two general groups are common descriptions of the type of apples--Red Delicious and all other varieties. The Red Delicious variety accounts for three-fourths of the apple acreage and 72% of the tree inventory January 1, 1986.

The distribution of Red Delicious apples by each fruit district and county is similar to the State, but shows variation. Chelan County's inventory of all apples indicate the highest percentage of Red Delicious of any county--81% of the acreage and 80% of the trees. Yakima and Okanogan Counties have the second and third ranking percentage of Red Delicious.

On the lower percentage Red Delicious ranking of counties, Kittitas County has just over half of the acreage and 29% of the apple tree inventory as Red Delicious. Other counties that have less than the State average percent Red Delicious are Walla Walla, Spokane, Franklin, Adams, Klickitat, Benton, and Grant Counties. Contributing factors for the lower percentage is a combination of smaller acreage and more diversity in new varieties being planted in recent years.

The distribution of Red Delicious by Fruit Reporting Districts shows the Wenatchee and Yakima Valley at the same ratio of Red Delicious at 77% of the acreage and 75% of the tree inventory. The Columbia Basin shows a slightly lower percentage with 70% of the acreage and 61% of the trees as Red Delicious. Other areas have 58% of the acreage and trees as Red Delicious.

## Apple Acreage and Trees Major Counties and Districts, Washington

Area	Acreage			Trees

## All Apples

### Acreage, by Year Planted and Density

Apples are the major fruit crop in Washington and have been the major fruit crop since records were started in 1889. Improved varieties and changes in cultural practices have resulted in more trees per acre during recent years.

Survey data for apples was summarized in four tree density per acre categories instead of the traditional standard, dwarf, and semi-dwarf categories. Acreage with a spacing pattern of 20 x 20 (20 feet between trees and 20 feet between rows) has 109 trees per acre. A spacing pattern of 10 x 20 was classified as 218 trees per acre. Higher density patterns of double rows such as 5 x 5 x 15 (a double row of 5 feet between trees, 5 feet between rows, and 15 feet between double rows) has 435 trees per acre.

Of the current inventory of all apples, over half of the 161 thousand acres (54%) has been planted since 1973 and 62% of the 30.6 million inventory of trees. The peak year for both acreage and trees was 1980. Plantings during 1985 were about one-third of the peak 1980 level.

The trend of higher tree density during recent years is significant. The peak year for acreage in the 200-999 trees per acre categories was 1980. The less than 200 trees per acre and the 1,000+ group peaked in 1981. The tree inventory followed a similar pattern, but peaked in 1982 for the 1,000+ tree category.

The average trees per acre for apples in the State averaged 190 trees. Acreage planted prior to 1955 averaged 110 trees per acre, increased progressively through 1976, and averages over 200 trees per acre from 1977 through 1985. The year that had the highest density and only year that averaged over 300 trees per acre was 1984 at 320 trees.

## Red Delicious

### Acreage, by Year Planted and Density

Apple acreage totaled 160,980 on January 1, 1986 in Washington. Red Delicious varieties accounted for three-fourths of the total at 121,175 acres. The inventory of apple trees from the Fruit Survey totaled 30,602,800 trees. Red Delicious varieties accounted for 75% of the acreage and 72% of the total trees.

The bulk of the acreage has a tree spacing of less than 200 trees per acre, 52% for Red Delicious and 51% for other varieties. In the combined tree density groups of 400+ trees per acre other varieties had a higher percentage of the acreage, 8%, while Red Delicious had only 2% of the total in these higher density groups.

The inventory of trees, however, show the bulk of the inventory in the 200-399 trees per acre classification, 55% of the Red Delicious and 44% of the Other Varieties. The combined inventory of Red Delicious trees in the 400+ trees per acre was 7% compared with 27% for Other Varieties.

Oregonspur was the dominate Red Delicious strain for both acreage and number of trees. Red Chief and Bisbee were the second and third ranking strains for both acreage and trees.

Golden Delicious was the leading variety other than the Red Delicious. Granny Smith were the third ranking variety at 8,220 acres and 3.1 million trees. The Grannies are a relatively new variety for Washington and had the highest tree count per acre at 358 trees. Also, about 96% of the Granny acreage has been planted during the past 10 years.

## Apples, Minor Strains and Varieties

Major strains of Red Delicious and other apples were those strains or varieties that represented one percent of the State total. Data for the major strains and varieties are presented for county and district totals. Minor strains and varieties are those that represent less than one percent of the State total. Information for these minor strains and varieties are presented individually for the State total and grouped as other strains or varieties in the county and district tables.

Minor strains of Red Delicious apples accounted for 14,530 acres and 2.8 million trees. There were 23 separate strains that accounted for 10,690 acres and 2.0 million trees. Red King and Silver Spur were the two strains with the largest acreage. Chelan and Scarlet Spur were the third and fourth largest acreage.

The trees per acre for the minor Red Delicious strains averaged 194 trees per acre, slightly higher than the total Red Delicious average of 182 trees per acre. There were eight minor strains that averaged over 200 trees per acre with Scarlett Spur being the highest at 244 trees.

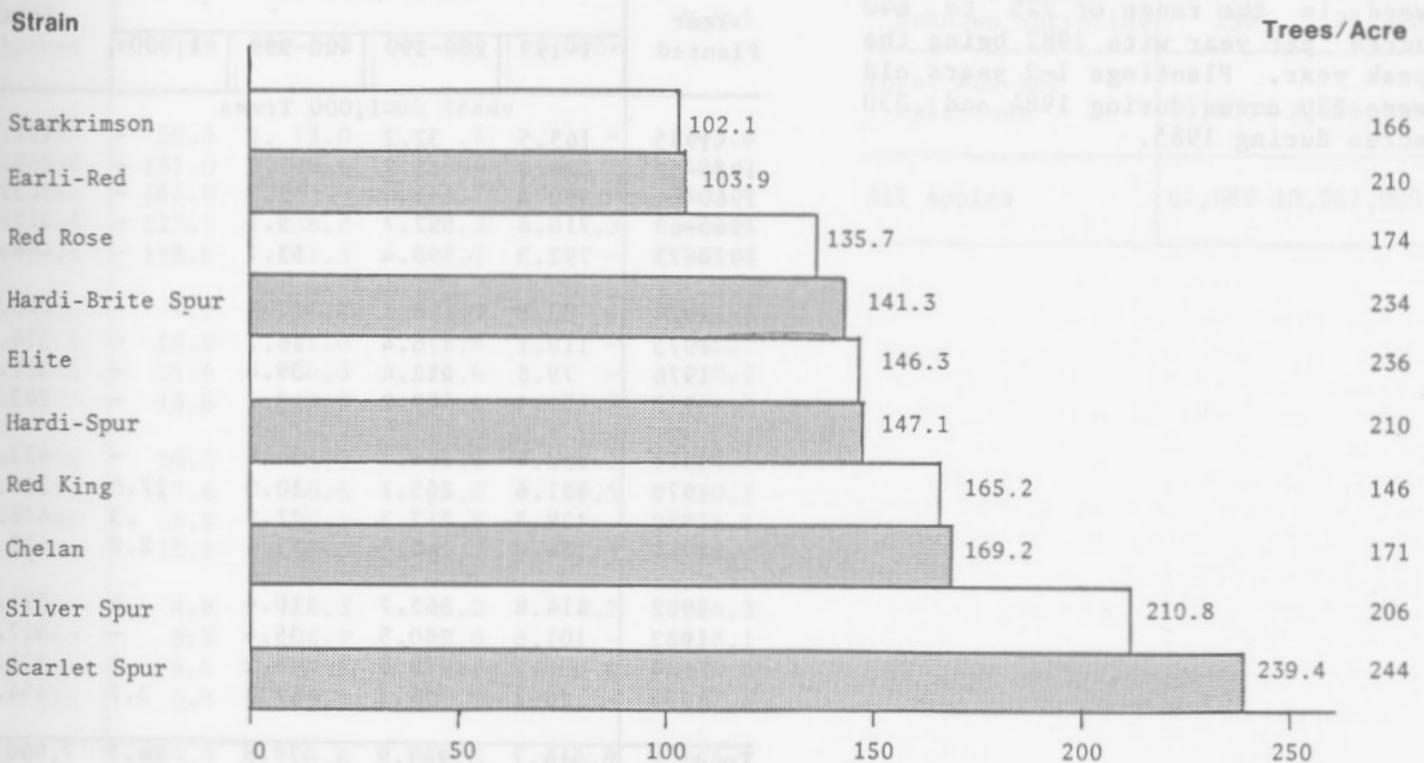

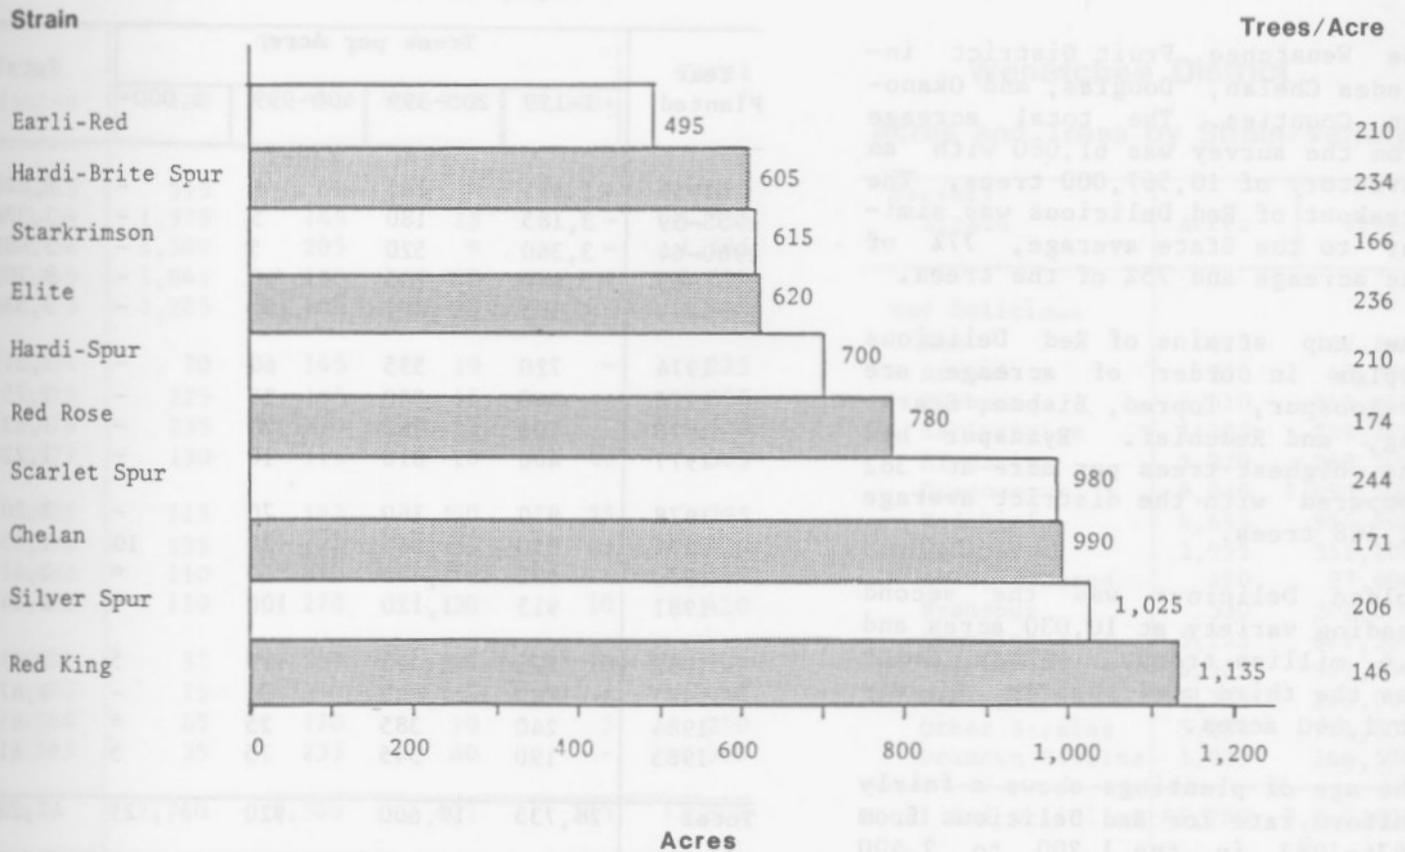

Other apple minor varieties accounted for 2,495 acres. Seventeen varieties accounted for 2,340 acres. An additional 6 varieties were reported, but the acreage was less than 2.5 acres for each variety with more than 100 trees. The combined 23 varieties accounted for 503,400 trees.

Jonathon, Criterion, and Newton were the three minor varieties with the largest acreage respectively. Gala and Jonagold are two new varieties that had 230 and 185 acres reported respectively. Gala and Jonagold both had a tree density per acre over 300--Gala at 315 and Jonagold at 319 trees per acre.

# Wenatchee District

## Red Delicious

### Acreage, by Year Planted and Density

The Wenatchee Fruit District includes Chelan, Douglas, and Okanogan Counties. The total acreage from the survey was 61,080 with an inventory of 10,567,000 trees. The breakout of Red Delicious was similar to the State average, 77% of the acreage and 75% of the trees.

The top strains of Red Delicious apples in order of acreage are Oregonspur, Topred, Bisbee, Starking, and Redchief. Ryanspur had the highest trees per acre at 382 compared with the district average of 168 trees.

Golden Delicious was the second leading variety at 10,030 acres and 1.6 million trees. Granny Smith was the third most popular variety at 1,840 acres.

The age of plantings shows a fairly uniform rate for Red Delicious from 1974-1983 in the 1,200 to 2,400 acreage range. Plantings 1-2 years old dropped to 650 and 615 acres respectively for 1984 and 1985. Other apple varieties for 1974-1983 were in the range of 225 to 640 acres per year with 1982 being the peak year. Plantings 1-2 years old were 250 acres during 1984 and 350 acres during 1985.

# Yakima Valley District

## Red Delicious

### Acreage, by Year Planted and Density

The Yakima Valley Fruit District is the largest apple area in the State with 70,715 acres and 13.0 million apple trees. The Yakima Valley includes Benton, Kittitas, and Yakima Counties. Red Delicious was the dominate variety of apples with 77% of the acreage and 75% of the trees.

The top strains of Red Delicious apples in order of acreage were Bisbee, Oregonspur, Redchief, and Starking. The top three strains each had over one million trees with Redchief as the leader with 1.6 million trees. Ryanspur had the highest trees per acre at 226 compared with the district average of 181 trees.

Golden Delicious was the second leading variety with 9,555 acres and 1.5 million trees. Rome Beauty was the third leading variety. Granny Smith averaged 390 trees per acre compared with 190 trees for the Other Apple District average.

The age of planting for Red Delicious shows more variation than other districts. The peak year was 1979 with 4,415 acres whereas other districts peaked in 1980. Red Delicious plantings in the Yakima Valley decreased during 1980 and 1981 to 3,780 and 2,730 acres respectively. Plantings increased to 3,255 acres in 1982.

Other apple age of plantings indicate a more uniform rate of increase from 1974 to the peak year 1979 at 965 acres. Plantings during 1980 were near this level with 960 acres, dropping to 710 acres in 1981 and up to 850 acres for 1982. Other apple plantings decreased for 1983 and 1984 but increased to 875 acres for 1985.

## Columbia Basin District

The Columbia Basin Fruit District is the youngest apple area and includes Adams, Grant, and Franklin Counties. The total apple acreage is 23,580 acres with 5.9 million trees. Red Delicious is still the dominate variety, but is below the State average for both acres and trees. The Columbia Basin has 70% of the acreage and 61% of the apple trees as Red Delicious.

The top strains of Red Delicious were Oregonspur, Redchief, and Bisbee respectively for acreage and trees. Oregonspur was the only strain with more than one million trees and totaled just over 1.1 million trees. Ace Strain had the highest trees per acre at 341 trees compared with the district average of 218.

Granny Smith was the second leading variety with 3,575 acres and 1.6 million trees. Golden Delicious was the third ranking variety with 2,565 acres and 565,000 trees. The Granny tree density was 434 trees per acre compared with the 218 for Red Delicious and 321 for the district other apple average.

The age of plantings is reflective of the Basin developing as an apple area. Three-fourths of the Red Delicious and 80% of the other varieties were planted in 1978 or later. The peak year for Red Delicious was 1980 at 3,685 acres. Planting of Red Delicious apples during 1983 through 1985 were significantly less and in the 410 to 630 acre range. Other apple variety plantings peaked in 1981 at 1,590 acres. Plantings during 1983 were also high at 1,110 acres but have slowed to 445 and 300 acres respectively for the last two years.

The Columbia Basin is also significant when the tree density groupings are reviewed. Over half of the State's acreage and trees in the 1,000+ trees per acre group are in the Columbia Basin.

<b>All Apples</b>	<b>23,580</b>	<b>5,913,200</b>

## Other Areas (FRD 1, 2, 6, and 7)

Other Areas includes Fruit Reporting Districts 1, 2, 6, and 7 or all areas not included in the Wenatchee, Yakima Valley, and Columbia Basin. Major counties in the Other Area include Klickitat, Spokane, and Walla Walla Counties. The apple acreage in the Other Areas is 5,605 acres with 1.1 million trees. The combined totals for Klickitat, Spokane, and Walla Walla Counties are 4,360 acres and 902,100 trees. Red Delicious apples are still the dominate variety with 58% of the acreage and trees.

Leading strains of Red Delicious apples for the Other Areas were Redchief, Oregonspur, Bisbee and Ryan. Redchief averaged 248 trees per acre compared with the area average of 189 trees for Red Delicious. Granny Smith was the second leading variety with 1,270 acres and 314,100 trees. Grannys averaged 247 trees per acre. Other varieties for the Other Areas averaged 215 trees per acre.

The age of plantings for the Other Areas shows a similar pattern as other fruit districts, 1980 was the peak year for Red Delicious and 1981 was the peak for other varieties. The age of plantings also show a similar pattern as the Columbia Basin by having 72% of the acreage and 74% of the trees being planted in 1978 or later.
