INVENTORY OF COMMERCIAL CITRUS ACREAGE
AS OF DECEMBER 1969

FLORIDA DEPARTMENT OF AGRICULTURE
DOYLE CONNER, COMMISSIONER
Tallahassee, Florida

FLORIDA CROP AND LIVESTOCK
REPORTING SERVICE

DIVISION OF PLANT INDUSTRY

Joe E. Mullin, Statistician In Charge
Orlando, Florida

Halwin L. Jones, Director
Gainesville, Florida

ACKNOWLEDGEMENTS

The inventory data contained in this report were developed at the request of and with funds provided by Florida's Citrus Industry. Its leaders sought accurate information for projecting future production. In addition, they recognized the need to maintain citrus tree and acreage inventories on a current basis in the future.

Use of aerial photography in the survey was developed in part with U. S. Department of Agriculture matching funds under the Agricultural Marketing Act of 1946, and resources of U. S. D. A.'s Statistical Reporting Service.

The work was directed by the Florida Crop and Livestock Reporting Service who supervised photography, photo interpretation, field checking, and assembling of the data. Field survey work was a continuing cooperative project of the Florida Crop and Livestock Reporting Service and the Division of Plant Industry.

Private and public officials contributed to this work by supplying information and other assistance. Many growers supplied basic data. The Growers Protective Division of Florida Citrus Mutual, county sheriffs, and county agricultural agents helped expedite field checking. These contributions are sincerely appreciated.

EXPLANATION OF CITRUS ACREAGE INVENTORY AS OF DECEMBER 1969

SUMMARY

This is the third publication of the inventory of citrus trees planted in Florida. In December 1965, the Florida Crop and Livestock Reporting Service began indexing citrus groves on current aerial photography. By March 1, 1967, the State's first comprehensive and current citrus acreage inventory was released. That inventory includes details by county, variety, and year set. The 1965 report was designed to be updated quickly and economically. A second complete inventory as of December 1967 was completed in mid 1968.

This third complete inventory relating to December 1969 was published in summary form in August 1970. It required about 8 months of intensive effort to process and review new aerial photographs, detect changes by comparative photo interpretation, make necessary field checks of new and altered acreage, and catalog changes disclosed on photographs and in field observations. This application of proven technology to an agricultural problem has provided current data, indicating Florida's potential for future citrus production, within a shorter period of time than could be achieved by ground survey methods alone, and at less cost.

AERIAL PHOTOGRAPHY

Flight lines established in 1965, and re-flown in 1967, were rephotographed in late 1969. The area photographed at a scale of 1 to 30,000 covers approximately 12,000 square miles and contains 99 percent of the commercial citrus in Florida.

Photographing began the first week in November 1969 and was more than 95 percent completed by the end of December. The remainder was flown shortly afterwards.

STEREOSCOPIC EXAMINATION

Using F-71 stereoscopic viewers with binoculars to examine two contact prints simultaneously, it was possible to quickly detect changes occurring between 1967 and 1969. Altered ground characteristics resulted in loss of third dimensional effect, making such changes as new

groves, additions to existing groves, pushed groves, and other significant alterations quickly identifiable.

FIELD INSPECTION

In late December 1969 field crews began ground checking points on the new photography questioned by photo interpreters. Most field time was consumed indexing new groves set since the last survey. In addition, any alteration in previously surveyed groves was recorded. All blocks that had numerous vacancies in 1967 were checked for resets. Field crews identified varieties of many young blocks which had been too young to identify in earlier surveys. Scattered acreage photographed was completely rechecked by field inspectors. Field work was completed in early June, six months after the detailed reviews.

GROVE INDEXING

Following field inspection, photo interpreters indexed new blocks of fruit on enlarged aerial photographs. Polar planimeters were used to measure new and changed acreage. Tree numbers were computed from the combination of these measurements and tree spacing measured by field men. All the statistical information, including variety, year set, acreage, tree numbers, and other identifying features, were recorded on punch cards and summarized on EAM equipment.

NON-PHOTOGRAPHED AREAS

Flight lines were laid out for maximum grove coverage at minimum cost. It was economically feasible to photograph 2,800 scattered acres of citrus. These 2,800 acres were thoroughly checked by ground survey teams.

A light airplane was employed to strip fly all areas of the citrus belt not actually photographed, to locate any newly established groves.

NET ACRES IN COMMERCIAL GROVES

The data in this report relate to groves containing a minimum of 50 trees and being maintained for commercial production.

The acreage shown is that actually plant-

ed to trees. Bayheads, ponds, sink holes, drainage canals and laterals, swale ditches, roads, turn rows, and wide middles were excluded. Where vacancies within a commercial grove were numerous, they have been counted and acreage adjusted downward to equivalent acres of commercial trees. These groves will automatically be revisited every two years to determine acreage reset.

CHRONOLOGICAL AGE USED

Data are listed by "year in which set". This relates to the year in which the trees were set in the grove. Grove managers' records were used to establish age where available. Otherwise age of older trees was estimated based on trunk circumference. Age of young trees were estimated from both trunk circumference and height.

INTERSET AND MIXED ACREAGE

In blocks of citrus which are interset, acreage has been prorated proportionately by the ratio of trees of each variety or type and/or age. Groves that are thoroughly mixed because of more than one age or type of trees are also proportioned by this method. Small blocks and those with substantial variation have been classed as mixed and added to the miscellaneous citrus.

UNIDENTIFIED TREES

Identification of citrus varieties is dependent on presence of fruit. Many young groves enumerated for the first time are necessarily indexed as unidentified until fruit is available for variety determination. Acreage and trees in this report listed as "unidentified" will be resurveyed and reported in the next census.

USE OF EXISTING ENLARGEMENTS

Cronaflex enlargements used in the original survey are still utilized where changes in grove character have been nominal. This involved a considerable savings in dollar outlay and valuable time necessary to transfer block indexing to new enlargements. In the event there was significant change in the two year lapse, replacements were ordered. Enlargements, of course, were purchased in all new grove areas photographed for the first time.

It is anticipated that new cronaflex enlargements will be purchased for the 1971 aerial flight to update all photos to a new base. Ground topography and features have changed sufficiently since the orginal flight in 1965 to justify this shift.

ADDITIONAL SURVEY WORK

The Division of Plant Industry is continuing its disease and injurious insect detection program. In this activity, a systematic sample of groves is visited and inspector's record changes and essential statistical information on tree populations. During the period between the 1967 and 1969 census, about 60 percent of all the photographs were field checked.

In addition, Florida Crop and Livestock Reporting Service personnel are engaged in continuing survey work. Refinement in old records of existing groves and recording of new groves are resulting from these activities.

COLOR PHOTO RESEARCH

This year the Department contracted for 450 square miles each of Ektachrome color and False Color Infrared photography. One roll of each was shot simultaneously and in several diverse locations for comparison of the film types. These photographs will be used to develope better photo-interpreting techniques. These include delineation of abandoned groves, and locations of reset and interset trees as well as new groves. Another goal of this photography will be to determine if it is possible to accurately identify groves of different fruit types from color tones so that expensive ground inspection may be reduced.

A feasibility study is in progress to determine the advisability of changing from black and white panchromatic film to improved color photography.

THE COVER

The cover photo is an oblique shot in False Color Infrared looking westward along the "Sunshine State Parkway" just west of Ft. Pierce. It shows a panoramic view of citrus groves from nearly three miles high as the plane gets into position to begin the flight line. The variation in tones provides clues that can identify the character of the terrain and plant cover shown.
