ACKNOWLEDGEMENTS

The publication of this bulletin was made possible through the efforts and cooperation of many individuals as well as private and governmental institutions. To all of them the Florida Crop and Livestock Reporting Service wants to express its appreciation.

Many farmers and agricultural enterprises have voluntarily supplied information to develop these statistics. The Agricultural Stabilization and Conservation Service has been a source of much basic data on crops under U. S. D. A. programs. Others contributing information were the Florida Department of Agriculture, Agricultural Experiment Stations and Cooperative Extension Service.

This bulletin is published by the Florida Crop and Livestock Reporting Service, a cooperative agency of the Statistical Reporting Service, U. S. D. A., Florida Department of Agriculture; and Florida Agricultural Experiment Station. Acreage, production, and value data are official statistics prepared by the Florida Crop and Livestock Reporting Service.

SUMMARY OF THE 1972 FIELD CROPS SEASON

This annual publication contains statewide estimates of acreage, yield, production, price and value of production for major field crops produced in Florida. County estimates for major field crops are shown for the years 1967 through 1972. County estimates for 1967 through 1971 will vary from those published in previous annual bulletins for certain crops because of changes in total acreage or production for these crops resulting from the review of the 1969 Census of Agriculture. The complete series of crop estimates for the State is available from this publication and the publication "Field Crops Summary, 1919-1967", which is available upon request from this office.

The rainfall and temperature conditions which produced the 1972 field crops were highly variable. January and February were unusually warm with very few cold spells occurring during this period. The warm weather and dry spells experienced during the early part of 1972 were particularly detrimental to the small grain crops in the State. Brief periods of freezing weather in the northern and western parts of the State during the winter months caused no particular damage.

The early part of February was cold with some heavy rains early in the month. Temperatures dropped below freezing on February 3 in the north central areas, but winds prevented any frost. Favorable weather during February 14-18 was halted by cold, hard winds. Otherwise, the spring was generally dry throughout most of the State until Hurricane Agnes arrived off the west coast on the weekend of June 17-18 and proceeded north on June 19. Agnes brought badly needed rain to much of the State and was particularly beneficial to the western and northern portions of Florida. This resulted in the first and only general wide-spread rains received in major crop producing areas during the spring and summer of 1972. An all out effort was made to get the remaining unplanted crops into the ground while moisture was still adequate for sprouting and growth.

During the summer months scattered rainfall provided moisture in some areas while heavy showers were detrimental in other areas. The localized nature of the rainfall caused wide variations in yields of most crops with some areas having excellent yields and other areas having near crop failures. Generally, dry conditions continued until more widely spread rains were received around Thanksgiving. These, however, were too late to benefit any of the field crops.

Corn continued to have the largest acreage of any single crop in the State. However, the 1972 crop was planted on 2% fewer acres than in 1971. Corn yields were also below the near record crop of a year earlier, but the 46 bushels yield per acre was considerably above the low yielding years of 1969 and 1970. Total production of 14.1 million bushels with a season average price of \$1.39 per bushel produced a total value of the crop of 19.6 million dollars. The 1972 crop was the third highest in value of production falling behind peanuts and sugarcane.

The value of sugarcane at 121.8 million dollars far exceeds the value of any other single crop in the State and in 1972 exceeded the previous record high value of production by 47 million dollars. This increase in value was a result of

a higher season average price, a larger yield per acre as well as a 26 percent increase in harvested acres over the preceding year. Warm weather during the winter of the 1971-1972 season caused heavy growth resulting in a near record yield of 38 tons of cane per acre. This was the highest yield in recent years and was preceded only by a yield of 41.7 tons per acre realized in 1957. Acreage of sugarcane has steadily increased since the 1969 crop of 160,100 acres. The 1972 harvested acres totaled 251,000 acres.

Soybeans continued to increase in importance in the State and in 1972, ranked fourth in value of sales and third in total acres harvested. The acreage of soybeans harvested has steadily increased since 1961 and during the past ten years, have gone from 40,000 acres to 232,000 acres. This acreage is primarily located in the western portion of the State and is competitive with much of the corn crop and is often planted following small grains. The yield in 1972 was only 21 bushels per acre compared with a yield of 28 bushels realized in the prior two years. However, increased prices applied to a bit lower production produced a total value of the crop of 17.5 million dollars. Last years individual soybean yields were widely variable resulting mostly from the local nature of the rainfall during the year.

Florida producers harvested 183,000 acres of grass for hay which produced 311,000 tons of hay for the State's livestock industry. The season average price of \$37.00, which was the highest realized in many years, produced a crop value of 11.5 million dollars.

The acreage of cotton harvested in 1972 was up from the prior three years as the cotton acreage continued to be consolidated in certain counties and to be consolidated into larger producing units. The major cotton producing county, Santa Rosa, has approximately 75 percent of the State's acreage and produces approximately 85 percent of the State's cotton. The yield realized in 1972 of 585 pounds of lint per acre was below the earlier yield of one year ago, however, the increased acreage produced the largest total production since 1965.

The acreage planted to peanuts continued to decline, resulting from fewer acres planted for "hogging-off". Last year's peanut yield of 2,050 pounds average for the State was below the record 2,550 pounds realized a year earlier. However, the increased price at 14.5 cents per pound resulted in a value of production which exceeded the 1971 production by approximately 400,000 dollars. Local yields realized by producers were highly variable as localized rainfall either did or did not provide adequate moisture for good growth.

Yields of both flue-cured and shade tobacco were lower than expected earlier in the season. Hurricane Agnes damaged some shade structures and wind whipped the leaves of both shade and flue-cured tobacco. Flue-cured acreage remains steady at 10,100 acres. The price, however, in 1972 was higher than had been realized in any recent years. The season average price of 85.3 cents per pound resulted in a total value of 16.9 million dollars which was slightly higher than had been realized the previous year. The shade tobacco price of \$2.80 per pound was higher than in previous years resulting in total production exceeding the 1971 figure by 5%.
