Agricultural Marketing Service  
and  
Statistical Reporting Service

### ACKNOWLEDGMENT

The publication of this bulletin was made possible through the efforts and cooperation of many individuals as well as private and governmental institutions. To all of them the Florida Crop and Livestock Reporting Service expresses its appreciation.

Many farmers and agricultural enterprises have voluntarily supplied information to develop these statistics. The Agricultural Stabilization and Conservation Service has been a source of much basic data on crops under U. S. D. A. programs. Others contributing information were the Florida Department of Agriculture, Agricultural Experiment Station and Cooperative Extension Service.

This bulletin is published by the Florida Crop and Livestock Reporting Service, a cooperative agency of the Statistical Reporting Service, U. S. D. A., Florida Department of Agriculture; and Florida Agricultural Experiment Station. Acreage, production, and value data are official statistics assembled under the direction of Gerald H. Moody and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service.

## INTRODUCTION

This publication, released annually, contains statewide estimates of acreage, yield, production, prices and value of production for all major field crops grown in the State. The period covered for these crops is from 1971 through 1975. County data for the important producing counties which grow corn, wheat, soybeans, peanuts, cotton and tobacco are published for the years 1973, 1974 and 1975. The complete series of crop estimates for the State are available upon request.

Crop estimates are designed to help Florida farmers, bankers, credit organizations, research workers and others in agriculture keep abreast of current changes and appraise future needs in the light of past experiences. The estimates represent a part of the Department's continuing program to provide comprehensive data for the various segments of agriculture.

## SUMMARY, 1975 SEASON

Temperatures during the winter averaged above normal while rainfall was variable with the Panhandle receiving the heaviest amounts. The spring months were generally dry in the south and central areas but soil moisture was adequate to excessive in the north and west. Planting of field crops progressed on schedule. Weather was generally favorable during most of the growing season and crops made fair to good progress. Harvest of early planted crops was underway by mid-summer. Heavy rains in August caused some flooding of low lands in the Panhandle. There was heavy crop damage in the flooded areas, reducing yields and production. Hurricane Eloise passed through the Panhandle in late September, causing extensive damage to unharvested crops, pecan trees and timber. The five-county area of Okaloosa, Walton, Holmes, Washington and Bay was the most severely hit. By late October, harvest was back on schedule in the Panhandle and about complete in other areas. Seeding of small grains got underway on schedule and was complete by the end of November. Sugarcane harvest was active during the fall months and increased rapidly during the winter months.

The planted acres of corn continued to increase following the trend of recent years. The acreage harvested for grain was down slightly from 1974, due mainly to damage caused by Hurricane Eloise. However, acres harvested for grain was higher than other recent years. The average yield per acre was 45 bushels compared with 48 bushels in 1974. The season average price declined from \$3.30 per bushel in 1974 to \$2.70 in 1975. The decline in harvested acres combined with lower yields and lower average prices caused the value of production to drop to \$47,871,000, a decrease of 24 percent from 1974.

The total acreage of sugarcane harvested for sugar and seed was a record 298,000 acres. This was 10 percent higher than in 1974. The average yield per acre was 35.9 tons, 8.1 tons more than in 1974. Total production for sugar and seed was a record 10,698,000 tons, an increase of 40 per-

cent from 1974 and 12 percent above the previous record set in 1972. The season average price declined sharply from the 1974 average of \$46.50 to \$20.80 per ton. The value of production for sugar and seed was \$222,518,000, down 37 percent from the \$353,307,000 in 1974. The value of production for sugar only was \$213,491,000 compared with \$334,056,000 in 1974.

The acreage planted to soybeans continued the upward trend with 305,000 acres planted. The area harvested for beans totaled 295,000 acres, a 6 percent increase from 1974. The average yield per acre was 24 bushels, down 3 bushels from the 1974 yield. The season average price dropped from the record \$7.30 per bushel in 1974 to \$4.40 and was the lowest price since 1972. The value of production totaled \$31,152,000, down 43 percent from 1974.

The production of hay totaled 404,000 tons, second only to the record 414,000 tons produced in 1974. Total area harvested was 207,000 acres, an increase of 5 percent from a year earlier. The average yield per acre was 1.95 tons, compared with the 1974 yield of 2.10 tons. The season average price dropped from \$56.00 per ton a year earlier to \$54.00 per ton in 1975. The value of production, at \$21,816,000, was 6 percent less than the value of the 1974 crop.

The acreage planted to cotton was at a record low 4,000 acres, less than a third of the 1974 planted acres. The total acreage harvested was 3,700 acres. The yield in 1975, at 350 pounds per acre, was the lowest since 1967. The average price received was 55 cents per pound, up 16 cents from 1974, and 4 cents above the previous record of 51 cents received in 1973. Santa Rosa County continues to dominate cotton production in the State, accounting for 87 percent of the acreage and 89 percent of the production.

Total acreage planted to peanuts continued to decline. In 1975, 63,000 acres were planted, down 5 percent from the 66,000 acres planted in 1974. Area harvested for dry peanuts at 55,000 acres, remained the same as the last two years. The remaining acreage was harvested as green peanuts and for other purposes. A record yield of 3,230 pounds per acre was realized. This was an increase of 130 pounds from the previous record of 3,100 pounds produced in 1974. The season average price was a record 19.9 cents per pound and, combined with the record production, pushed the total value to \$35,352,000, a gain of 15 percent from 1974.

The acreage of flue-cured tobacco harvested in 1975 totaled 13,500 acres, up 15 percent from a year earlier. The average yield was 2,080 pounds, down 65 pounds from the 1974 record of 2,145 pounds. The season average price was 97.5 cents per pound. The value of production was a record \$27,378,000, up 8 percent from the previous record set in 1974. Shade tobacco acreage continued the downward trend of recent years. Only 1,000 acres were harvested in 1975. The average price received was \$4.00 per pound, up 20 cents from the year before.
