ACKNOWLEDGMENT

The acreage, production and value statistics in this bulletin are official State and USDA estimates prepared by the Florida Crop and Livestock Reporting Service. The county and area detail were made possible by the participation of the Department of Food and Resource Economics, University of Florida, in the estimating program. The Bureau of State Markets, Florida Department of Agriculture, and the County Extension Agents, University of Florida's Cooperative Extension Service, were also very helpful in supplying area and county information. Shipment statistics were provided by the Market News sections of the Florida Department of Agriculture and the USDA Agricultural Marketing Service.

Grower organizations have provided valuable assistance and data throughout the season. These groups include the Florida Celery Committee, Florida Tomato Committee, Florida Sweet Corn Exchange, South Florida Vegetable Exchange, Zellwood Sweet Corn Exchange, and North Florida Growers Exchange. Sales agencies and transportation firms provided the inputs necessary to complete the statistical story.

Foremost, the growers, shippers and processors volunteered most of the basic data used in developing these official statistics. The public spirited cooperation of these individuals and groups is appreciated.

Fieldmen James Spires, Immokalee; J. B. Joiner, Homestead; Wallace Jacobs, North Palm Beach; and Larry Amlong of Palmetto collected much of the basic acreage, production and price statistics in this bulletin. This report was assembled under the direction of Alan Dale Atkinson, Gerald H. Moody and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service and E. F. Scarborough, Bureau of Market News.

PRINCIPAL VEGETABLES
BY
PRODUCING AREAS

1. WEST
   - A. Escambia county - Potatoes.
   - B. Holmes-Jackson-Washington counties - Butter beans, field peas, watermelons.
   - C. Gadsden county - Pole beans, squash, sweet corn, tomatoes.
2. NORTH
   - D. Starke-Brooker-Lake Butler - Lima beans, snap beans, cucumbers, green peppers, squash, strawberries.
   - E. Hastings - Cabbage, potatoes.
   - F. Gainesville-Alachua - Bush beans, cucumbers, peppers, potatoes, squash.
   - G. Island Grove-Hawthorne - Cucumbers, peppers, sweet corn, squash, watermelons.
3. NORTH CENTRAL
   - H. Oxford-Pedro - Tomatoes, watermelons.
   - I. Sanford-Oviedo-Zellwood - Cabbage, carrots, celery, sweet corn, cucumbers, escarole, greens, lettuce, peppers, radishes, spinach.
   - J. Webster - Cucumbers, eggplant, peppers.
4. WEST CENTRAL
   - K. Plant City-Balm - Bush and pole beans, lima beans, cabbage, cucumbers, eggplant, field peas, greens, squash, strawberries, watermelons.
   - L. Palmetto-Ruskin - Cabbage, cauliflower, potatoes, strawberries, tomatoes, watermelons.
   - M. Sarasota - Cabbage, celery, sweet corn, escarole, lettuce, radishes.
   - N. Wauchula - Cucumbers, eggplant, peppers, tomatoes, watermelons.
5. EAST CENTRAL
   - O. Ft. Pierce - Tomatoes, watermelons.
6. SOUTHWEST
   - P. Ft. Myers-Immokalee - Sweet corn cucumbers, eggplant, peppers, potatoes, squash, tomatoes, watermelons.
7. EVERGLADES
   - Q. Bush beans, cabbage, celery, Chinese cabbage, sweet corn, escarole, greens, lettuce, potatoes, radishes.
8. SOUTHEAST
   - R. Martin county - Cabbage, potatoes, tomatoes, watermelons.
   - S. Pompano - Bush beans, lima beans, sweet corn, cucumbers, eggplant, peppers, squash, tomatoes.
   - T. Homestead - Bush and pole beans, cabbage, sweet corn, cucumbers, potatoes, squash, strawberries, tomatoes.

Commercial Vegetables Watermelons

Florida: Usual dates for planting and harvesting vegetables, melons, potatoes, and strawberries

Crop	Planting Dates 1/	Usual Harvest Dates		
		Begins	Most Active	Ends
Snap Beans 2/	Aug 15 - Apr 1	Oct 15	Nov 1 - May 1	Jun 15
Cabbage	Sep 1 - Mar 15	Oct 25	Jan 1 - Apr 15	Jun 15

Summary of Shipments by Crops, by Months, 1975-76		--	46	--
Imports by Crop, by Origin 1975-76		--	--	69

QUARTERLY GROUPS--During the growing season estimates were prepared for most crops on a calendar quarter to indicate available supplies for shorter periods of time than the entire crop year. The Fall, Winter, Spring quarterly estimates are combined into a crop year total for all crops. Production sold or utilized is shown by months.

PLANTED ACREAGE is the total acreage which has been planted for harvest during one designated quarter. Acreage lost and replanted to the same crop in time for harvest in the same quarter, is counted only once. Acreage harvested and planted again to the same crop is counted twice.

HARVESTED ACREAGE is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

YIELD is the acreage production per acre of merchantable quality harvested and sold or utilized.

PRODUCTION is the quantity actually harvested and sold or utilized.

ECONOMIC ABANDONMENT is that portion of the crop that reached maturity and was of merchantable quality but was not harvested because of labor shortages, low prices or other economic factors; or if harvested, was not sold or utilized for those reasons. Estimates of acreage and production lost because of economic reasons are difficult to define and measure, and are not attempted unless such losses become significant.

UNIT VALUE for fresh market sales is the equivalent price received on an f.o.b. shipping point basis and encompasses all grades and sizes marketed or utilized. Included are packing charges, selling charges, precooling top ice, or other costs which contribute to the value of the product at shipping point. The value per unit for quantities sold to processors is the average value paid for usuable quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

TOTAL VALUE is the equivalent value of production sold or utilized based on the unit value. Cullage and other quantities not sold or utilized because of natural or economic factors are excluded.

OTHER COUNTIES include harvested acreage for all counties for which either published data would result in the disclosure of individual operations or acreage totals for specific commodities are of minor importance in the State.

RAIL TRUCK (Piggyback) shipments are included in the straight rail shipments shown for each crop, unless specified.

RAIL LOAD FACTORS represent the average number of packages per rail car based on tabulations of waybills in prior years showing the contents of each car.

MIXED CARS (RAIL)--Loadings by stations are pro-rated by commodities, using tabulations of waybills in prior years.

TRUCK SHIPMENTS are converted to equivalent carlots on the basis or predetermined load factors. A minor difference of carlot equivalents in the season total obtained by adding the monthly or weekly shipments may exist because of rounding.

PRODUCTION AND PRICE UNIT-- The offical USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to the most commonly used containers. If changes in container weights are necessary, all data pertaining to the production of the commodity in question is revised to maintain comparability between years. The table below gives the net weight used per container and the number of containers per hundredweight.

PRODUCTION AND PRICE UNIT

Most Common Unit Estimated Net Weight, Number of Units per Hundredweight, Principal Vegetable Commodities, Florida, 1975-76 Crop Season

Commodity	Unit	Est. Net Weight	No. of Units per Cwt.	Commodity	Unit	Est. Net Weight	No. of Units per Cwt.
		Pounds				Pounds

Lettuce	Cwt.	100	---				

SUMMARY OF THE 1975-76 VEGETABLE SUMMARY

Value of Florida grown vegetables, melons, potatoes, and strawberries totaled a record $524.4 million for the 1975-76 season. This was an increase of $38.1 million over the previous season. Acreage harvested increased 7 percent over the previous year. Crops showing the greatest gains were snap beans, sweet corn, lettuce, green peppers, tomatoes, watermelons and potatoes. Crops increasing in value were celery, sweet corn, escarole-endive, lettuce, green peppers, squash, tomatoes "other vegetables," potatoes and strawberries. Crops with lower values than the previous year were snap beans, cabbage, cucumbers and eggplant. Most of the declines were due to lower season average prices. Potatoes which rose $17.1 million, showed the greatest increase in value, followed by celery and tomatoes which increased $15.1 million and $13.9 million, respectively. "Other" miscellaneous vegetables totaled $38.7 million, an increase of $2.3 million from a year ago.

Average yields for celery, sweet corn, cucumbers, lettuce, and potatoes increased during the year while cabbage, eggplant, escarole, green peppers, radishes, squash, tomatoes, watermelons and strawberry yields declined slightly. Improved varieties, cultural practices and weather conditions can affect crop yields considerably.

Season average price of celery, escarole, lettuce, green peppers, radishes, squash, tomatoes and potatoes were higher than a year earlier. Season average prices for snap beans, cabbage, sweet corn, cucumbers, eggplant, watermelons and strawberries were below a year earlier.

In August, land preparation, planting and transplanting was quite active in most areas. Generally normal weather prevailed over most of the farming areas during September. Temperatures moderated in October. Most areas had excessive rainfall. Temperatures were generally mild during November. Harvest gained momentum during October and November.

Temperatures during December were variable. Light frost in west central and southwest areas caused minor damage. Another cold front moved into the southern farming areas during January. Light frost caused only minimal damage, mostly to young foliage. Strong, gusty winds caused sand to blow with moderate damage to young plants in exposed fields. Cold temperatures slowed growth and delayed maturity. Irrigation was active during the month. Spray programs were stepped up to combat disease.

In early February, several cold fronts moved through the south Florida growing areas. Scattered frost occurred in many areas. There was not much additional damage from earlier frost. Plant growth was set back several weeks by the cool weather. Warming trends occurred after each cold front and plants began making progress. Weather was mostly favorable the last half of February. Plants made excellent progress as growing conditions improved.

In March, weather was generally favorable for crop growth and development. Warm days and mild nights prevailed. Locally heavy rainfall occurred in some sections during the month. However, irrigation continued in most areas.

Daytime temperatures were generally warm and nights mild during April. Rainfall in the vegetable farming areas was variable. Irrigation continued quite active. Most crops made excellent progress during the month. Spray programs were active and disease was mostly under control.

Hot days and warm nights prevailed during much of May. Scattered rainfall occurred over most of the vegetable farming areas. Rains interrupted harvest and caused some damage. Gusty winds and hail caused some damage to crops in the Pompano area. Disease became more prevalent and spray programs were stepped up.

In June, moderate to heavy thundershowers occurred in most farming areas. Temperatures were near normal. Most vegetable crops declined seasonally and harvest was practically over by the end of the month. However, watermelon harvest continued into July in the west. Also, sweet corn provided good supplies in June. Rains became a problem with harvest operations.

Much of the weather data for this summary was supplied through the Federal-State Agricultural Weather Service, Ruskin, Florida.

SNAP BEANS
1975-76

Florida growers produced 4.5 million bushels of bush and pole beans during the 1975-76 season. Acreage harvested during the season totaled 37,500 acres, up 6 percent from the 35,300 acres harvested during the previous season. The average yield for the entire season was 119 bushels per acre, as compared with 120 bushels per acre the previous year. The slightly lower yield was more than offset by the increase in harvested acres, and total production was 5 percent above the 4.2 million bushels produced in 1974-75.

The average f.o.b. price of $5.74 per bushel was 40 cents less than the previous year's record high. Total value, at nearly $25.6 million, was 2 percent below last year. The increased production partially offset the lower unit price.

Bush beans are grown in all areas of Florida with the exception of the east central and southwest areas. The southeast continues to be the major producing area. Pole beans are produced primarily in Dade County, with small acreage grown in Gadsden County and the west central area.

Earliest fall supplies of snap beans originate from West Florida. Production increases throughout the fall season as the north and west central areas, the Everglades and the southeastern districts begin harvest. The southeast is the sole source of supply during the winter. The other areas resume production in the spring.

Snap bean production extended from late September into early June. The fall crop peaked in December, followed by a decline in marketings in January and February. Production increased sharply in March, and the spring crop peaked in April. Nearly 22 percent of the marketings occurred in April, compared with 17 percent in April the year before.

Variable weather influenced last year's bean crop. Heavy mid-September rains in the southeast washed some fields, necessitating moderate to heavy reseeding. During the winter season, cold winds burned tender pin beans, reducing yields and delaying maturity somewhat. However, slightly lower winter bush bean yields were partially offset by an acreage increase of high-yielding pole beans in Dade County. Weather during the spring season was mostly favorable, and yields were very good.

CABBAGE
1975-76

Cabbage production in Florida totaled 8.3 million sacks and crates during the 1975-76 season. The gross value was $19.3 million--down 26 percent from the record $26.1 million set a year earlier. The average f.o.b. price was $2.32 per sack or crate, down 59 cents from the previous season but 14 cents above the 1973-74 marketing period.

Acreage planted during the season totaled 18,200 acres, up nearly 5 percent from a year ago. Acreage harvested totaled 17,200, 2 percent above the previous season. Abandonment was higher than usual because of low prices during the late winter and early spring months. Yields were lower than a year ago and averaged only 483 crates or sacks per acre. Even though yields were down from the record 532 crates set the previous season, they were the second highest of record. Selective cutting during the periods of low prices kept yields lower than expected.

Cabbage was available for market from November through late June. Sales continued to be heaviest through the January-April period with the peak in March when 3,022 carlot equivalents moved out-of-state. This accounted for 26 percent of the total marketings, the same as last year.

The Hastings area, which includes Flagler, Putnam and St. Johns counties, is the major producing area, accounting for 54 percent of the State's harvested acreage. The north central area continued to rank second with 4,400 acres harvested and over 2 million crates produced. Good yields were obtained in all areas with the highest yields realized in the southern growing areas.

Seedbeds were prepared and transplanting got underway in late August and September. Transplanting and direct seeding was active in most areas from early October through January. By February direct seeding was about complete, but transplanting continued through March.

First cuttings occurred the first week of November. Harvest increased rapidly as most areas were cutting by mid-December. Supplies increased sharply in January when all areas were cutting and continued to rise until the March peak. Volume remained heavy through April but declined sharply in late May. Sales continued into June and the season was completed by the end of the month.

CARROTS
1975-76

Production of carrots in Florida made rapid gains during the 1970-71 season and continued to increase through the 1972-73 season. Production in 1975-76 declined slightly. There were 1,095 carlot equivalents of fresh carrots shipped out-of-state last season. Processed shipments amounted to 209 carlot equivalents during the 1975-76 season, compared with 303 carlot equivalents a year earlier.

The muck soils around Lake Apopka, near Zellwood, and the Everglades provide a good medium for growth. The mini or finger carrot harvest usually begins in October and is complete by the end of May. Regular-sized carrots are harvested from November through June. The peak harvest period was December through May.

The cold weather during January and February of 1976 retarded growth and reduced the size and yields. Heavy rains during March caused some harvesting problems.

CELERY
1975-76

Florida celery marketings of 6.7 million crates were harvested from 9,700 acres. During the 1975-76 growing season, the average yield of 687 crates per acre compared with 655 crates for the previous year.

Prices were improved over the 1974-75 season. Celery averaged $6.14 f.o.b. per crate compared with $3.73 in 1974-75. Prices averaged above a year earlier for each quarter. The crop was valued at $40.9 million, an increase of 58 percent from the previous season.

The Everglades, with 84 percent of the harvested acreage, was the foremost area of production throughout the season. The north central area, supplemented by light volume from the Sarasota area, accounted for the remaining 16 percent of acreage and provided continuing supplies throughout the season.

Plant bed preparation and seeding was underway in early June. Transplanting became active in the Everglades and Zellwood in mid-August. Planting in the Everglades continued into early April, while some acreage in the north central district were still being seeded in early May. Growers in Sarasota planted mostly from October to March.

Light harvest began in mid-November. Growing conditions were hot and humid in early fall. Conditions were generally good in the winter and spring. Quality and yields were very good during the winter period. Disease and leaf miners were mostly under control. Trading was slow in March and some growers were unable to keep up with production. Demand increased in April and growers kept on top of cutting. Approximately 9 percent of planted acreage was not harvested for various reasons--a near normal level. Growers passed some acreage in order to maintain good quality.

Celery production was mostly stable from December to early June. Cutting declined seasonally in the last half of May and June. Harvest was completed in all areas by July 1.

Celery is subject to a federal marketing order administered by the Florida Celery Committee. Their field supervisors provide acreage and production data. In cooperation with the committee, these data are assembled into weekly and monthly reports.

CHINESE CABBAGE
1975-76

Chinese cabbage is grown primarily at Zellwood and in the muckland of the Everglades. Harvest was underway by mid-November. Volume was light through November but increased to good volume in December and January. Production peaked in April. Good supplies were available from December through April. During April, Zellwood was providing good volume while production in the Everglades was declining seasonally. The season was over in early May.

Yields and quality held up well during most of the season. The crop did not suffer significantly from adverse weather or disease.

SWEET CORN
1975-76

Florida, the nation's leading sweet corn producer, marketed 13.2 million crates during the 1975-76 season. Production increased 10 percent from the previous year. Growers harvested 57,400 acres, up 9 percent from the 52,700 acres harvested during the 1974-75 season and 15 percent above the 1973-74 acreage harvested. Yields averaged 231 crates per acre statewide compared with 227 crates a year earlier. Yields have averaged above 200 crates per acre for every year since the record 244 crate average in the 1972-73 crop year.

The season average f.o.b. price of $3.64 per crate was 13 cents below the average for the previous year. The total value of the crop was $48.2 million, up $3.1 million from the $45.1 million received for the 1974-75 crop. The value of sweet corn ranked second in the state in vegetable crops and was exceeded only by the value of tomatoes.

First plantings of the season were underway in the Everglades in mid-August. Seeding on the East Coast got underway in early October and increased rapidly as the month progressed. Excessive moisture slowed plantings in Dade County in early October but plantings were back to normal by mid-month. First harvest began in the Everglades in the week ended September 22nd and reached a fall peak in November. The declining harvest in the Everglades during December was partially offset by the lower east coast and Dade County.

The Everglades spring crop was underway by early April. The Everglades became the main source of supply in late April as the east coast and Dade County phased out. The transition of harvest from the Everglades to Zellwood occurred in mid-May. Zellwood increased to full supply by late May. Lake County provided a good volume in June. The season was over in early July.

Small acreage provided supplemental supplies at Zellwood and the west central area during the early fall, and at Sarasota in the early spring.

Weather during the growing season was generally favorable. Rain and wind caused some minor problems to young corn during the early fall growing season. Cold weather in late January slowed growth and damaged tassels and silk in the lower east coast and Dade County. Damage was generally light. Heavy rains caused some problems in the Everglades during April. The season was mostly favorable in the Zellwood area.

CUCUMBERS
1975-76

Florida production of fresh market cucumbers during the 1975-76 crop year totaled 4.3 million bushels, up 8 percent from the amount produced in 1974-75. The 16,000 acres planted continued the upward trend started a year ago. Acres harvested totaled 15,400 compared with 14,600 harvested a year earlier. Average yield per acre--282 bushels--was up 6 bushels from the previous year. Total production was valued at $15.8 million compared with $18.4 million for the previous year. The f.o.b. price for 1975-76 averaged $3.64 per bushel, down from $4.57 per bushel received for the previous year's crop. Average prices received for the important spring crop were considerably below average.

Supplies in 1975-76 were generally available from September through June, with light marketings in January through March. Much of the recorded shipments moving out-of-state January through March are from offshore and truck imports resold in mixed loads.

The production of cucumbers is well distributed across the state. The southwest area, with 49 percent of the planted acreage during 1976-77, is the largest area. The west central area accounted for 21 percent of the planted acres in the state. The areas in the west, north, north central and southeast provided the remaining crop.

Heavy rains in many areas during late September washed seed beds and leached fertilizer. Weather was mostly favorable during the late fall and winter. However, several cold fronts moved into the state and foliage suffered light damage from frost and cold winds. Some replanting was necessary in hardest hit areas. Conditions for the spring crop were good. Excellent yields were obtained. Size, quality and color were good.

EGGPLANT
1975-76

Plantings of 2,400 acres were 9 percent above the 1974-75 season. The acreage planted was the highest since the 1965-66 season when 2,400 acres were also planted. Yields averaged 688 bushels per acre, 4 bushels below the record high yield of 692 bushels produced a year earlier. Weather was generally favorable during much of the growing season. However, on several occasions, young fruit was damaged by wind and sand which caused scarring. This damaged fruit resulted in reduced packout. Some light foliage burn occurred from frost. Damage was mostly minor. In June heavy rains caused flooding in some low areas.

Production of eggplant increased to 1.6 million bushels, a record high level. Total value declined to $4.8 million compared with $5.5 million a year earlier. The decline was due to the lower season average price of $3.06 per bushel compared with $3.71 a year ago. The fall and winter crops averaged much lower in price than a year earlier, while the spring crop averaged higher.

The distribution of marketings was generally normal. Harvest began in October, reached a fall peak in November, and declined seasonally through February. Harvest again increased and reached a spring peak in April. Supplies were generally light in February and March. Harvest was virtually completed by early July. The southeast area around Pompano continued to dominate with 67 percent of the harvested acreage. The northern and central areas combined contributed 24 percent of acreage harvested with the remaining small acreage in the southwest.

Production was continuous through the entire crop year in the southeast and southwest, while the crops in western, northern and central areas were for fall and spring harvest only. Those areas receive too much freezing weather to grow eggplant during the winter months.

First sales were from cuttings in the western and northern growing areas in early October. Harvest followed the usual pattern and progressed southward in the fall, continued through the winter in southern areas and then moved back northward in the spring.

ESCAROLE-ENDIVE
1975-76

The production of escarole and endive during the 1975-76 season totaled 3.1 million crates. This compares with 3.3 million crates produced the previous year. The 5,800 acres harvested was up 100 acres from the previous season. Yield per acre averaged 532 crates compared with the record high 584 crates the previous year. Prices during the season averaged $3.19 per crate, compared with $2.61 a year earlier. The total value of sales, at $9.9 million, was 13 percent above the previous year and a new record high.

The Everglades, which had 72 percent of the harvested acreage in the 1975-76 season, began seeding in early September. Weekly planting schedules continued through most of March. Light harvest began in late October and supplies were continuous through May. The mucklands around Zellwood provided good volume in the late spring months. Smaller acreage grown on Lake Placid and Sarasota mucklands also furnished supplemental supplies during much of the season.

Sales started relatively slow in November but increased considerably to a good volume by December. Marketings reached peak levels in March. Good volume continued through April. Harvest declined seasonally in May and was over by June 1.

Growing conditions were generally favorable during most of the season. Excessive rains in October caused some damage and interrupted planting and harvest operations. Frost and wind burn in January and February caused light damage. Quality of escarole and endive was mostly good throughout the season.

LETTUCE
1975-76

Florida lettuce growers produced a record 1.5 million hundredweight during the 1975-76 season. This production topped the previous record set during the 1974-75 season by 14 percent. A 13 percent gain in harvested acres accounted for most of the increase since yield per acre was up only 2 percent. Average yield at 184 cwt. per acre did, however, represent a record high. The season average f.o.b. price of $10.35 per cwt. was $1.40 above the previous season. Prices during the entire season were well above a year earlier.

Acreage, production, and value statistics of lettuce in this bulletin combine the various types into a single estimate. These types include the predominant iceberg and romaine as well as Boston, bibb, and leaf. The Everglades muckland accounted for 79 percent of the planted acreage and was the source of a continuous supply which began in late October and ended in early June. Zellwood is the other major producing area, with Sarasota and the Lake Placid mucklands contributing light supplies during much of the season.

Seeding was underway by early September. All areas were actively planting by mid-month with the Everglades and Sarasota areas scheduling plantings through March in order to produce a continuous supply of the various types from October through May. The central area normally discontinues production on the mucklands from December through April. However, the warmer sand lands around Zellwood provide light supplies during the winter period.

Harvest was underway by late October with light volume through most of November. Supplies of all types increased in December with growers cutting in all areas. Volume reached peak levels during the period February through April. The Everglades provided the bulk of the volume by early January, but sizeable acreage in the central areas contributed to the spring supply. Production dropped sharply in May and was virtually over by June 1.

Weather was generally favorable during most of the growing season. Heavy mid-September rains caused some minor damage to low fields.

PEPPERS
1975-76

During the 1975-76 season, 7.2 million bushels of peppers were marketed from 15,900 acres. The average yield of 454 bushels per acre was 11 percent below the record high 510 bushels the previous year. Production was 5 percent below the previous year.

While production was down, the f.o.b. season average price was up from $4.96 to $5.45 per bushel. This higher per unit price resulted in record marketing proceeds. The total value of $39.3 million was 4 percent above the previous high established during the 1974-75 season. Prices were generally favorable throughout the season, but were especially good during the month of March. Marketings were light in October, increased to a high level by January and peaked in May. The season was virtually over by the end of June. The 8 percent increase in planted acreage statewide was the result of a rather substantial gain of 15 percent in the heavy producing southwest area. Planted acreage decreased in the southeast. The southwest accounted for 58 percent of the state's total pepper acreage. The southeast had 15 percent; the north central area, 13 percent; the north, 9 percent; and the west central area, 5 percent.

Heavy rains during mid-September caused above normal droppage of bloom and fruit in the southern areas, reducing fall yields somewhat. Damage was heaviest in fields without plastic. The crop condition improved when the showers dissipated. Cold damage was mostly moderate during the winter season. Cool January temperatures caused above normal droppage of bloom and fruit, reducing winter yields. Mosaic was a problem in some fields. Spring weather conditions were generally favorable, and yields improved.

POTATOES
1975-76

The production of potatoes in 1976, including both the winter and spring seasons, totaled nearly 6.3 million hundredweight, up 18 percent from 1975. A total of 31,900 acres was planted, compared with 27,600 acres planted last season. The 31,000 acres harvested were 3,500 more than a year ago. Total sales were $41.9 million, up 69 percent from the $24.8 million realized in 1975. The sharp increase in acreage combined with a $2.02 increase per cwt. in the average price received was responsible for the sharp gain in total value.

The average yield in 1976 was a record 203 cwt. per acre. The winter crop averaged 200 cwt., 5 cwt. above the previous season. The spring crop grown in the Hastings area averaged 210 cwt., a new record for this area. Spring potatoes grown in other areas did not do as well and averaged only 160 cwt. per acre, down 14 percent from last season.

The average price of $6.66 per cwt. was well above a year earlier but $1.06 less than the record $7.72 per cwt. received in 1974.

The winter crop in South Florida continues to be dominated by the "red-skinned" varieties used primarily for table stock. The spring crop grown in the Hastings area was mostly the "white-skinned" varieties used in making chips.

Weather conditions during the winter and spring seasons were generally good. There was no cold damage but heavy rains in some areas contributed to the low yields in the "other spring" crop.

The winter potato crop was off to a good start in early January but harvest slowed in early spring because of market conditions. Harvest extended into early May, longer than usual. The spring crop in the Hastings area followed a near normal seasonal pattern. Harvest got underway in early April and progressed rapidly to the May peak. Digging continued through June and was completed in July, a little later than usual.

RADISHES
1975-76

In 1975-76, radish plantings amounted to 29,200 acres compared with 31,000 the previous season. Acres harvested totaled 25,700 compared with 27,400 in 1974-75. Yields averaged 293 cartons per acre compared with 300 the previous year. The crop was valued at $15.8 million compared with $16.8 million a year earlier. The average f.o.b. price was $2.10 per carton, up 6 cents from the previous year.

A good supply of both red and white radishes were available from Zellwood, Lake Placid and the Everglades from October through May. The fall peak harvest occurred in December while April was the peak spring harvest. The season ended with a light volume in early June. Seeding of the 1975-76 crop was underway in the Everglades and north central areas in early September. A few loads were pulled in early October. Harvest was in full swing in early November. Supplemental supplies were available from Lake Placid and Sarasota during the year.

SPINACH FOR PROCESSING
1975-76

Spinach statistics are not published separately for Florida since the 1973 season to date in order to avoid disclosing individual operations. However, data for these seasons have been included in "other vegetables" in the overall summary table. Shipment data are shown on page 65. Favorable weather prevailed during most of the growing season. Most of the crop is grown in the north central and north areas.

SQUASH
1975-76

Florida's production of squash during the 1975-76 season, at 1.8 million bushels, was virtually unchanged from the previous season's record. Harvested acreage totaling 11,400 acres, an increase of 2 percent, offset a slightly lower yield. The average yield at 154 bushels per acre was down 6 bushels from the previous year.

The average f.o.b. price at $6.53 per bushel was the highest of record and 39 cents above the previous high of last season. This price, combined with the near record production resulted in a new high in value of sales. Total f.o.b. cash receipts amounted to over $11.5 million. Prices were generally favorable November through March, before tapering in the spring.

Florida produces acorn, butternut, yellow crookneck, yellow straightneck, white and zucchini squash. Dade County with 30 percent of the state's harvested acreage in 1975-76 produces yellow crookneck, almost exclusively. The Pompano area, in addition to being a major producing area, is also an important market for squash grown in other areas of the state. This is especially true when local supplies reach low levels during the winter months. The southwest produces a continuous supply of most types. Central, north, and west Florida provide a good volume of most types during the fall and spring seasons.

Squash is one of the few crops grown in Florida that is shipped every month of the year, although shipments during the summer are usually light and confined mostly to local markets. The 1975-76 season got off to a slow start as heavy mid-September rains caused some acreage loss and reduced yields for the fall season. Marketings increased to the fall peak in December, before showing a seasonal dip during the winter months. Cold winds and frost in January caused light to moderate damage to the winter crop, but warmer weather in February and March was beneficial, and overall yields for the winter quarter were good. Weather was generally favorable during the spring quarter, and production was heavy. Peak marketings for the 1975-76 season occurred in April.

STRAWBERRIES
1975-76

Florida strawberry growers produced 2.0 million flats of berries during the 1975-76 season, up 6 per cent from the previous year. Harvested acreage totaling 1,400 acres, increased 17 percent, more than offsetting a decrease in yield. The average f.o.b. return per flat was $4.33, unchanged from the previous season's average. The total value of the crop was a record $8.9 million, exceeding by 6 percent the previous record established a year earlier.

Laying plastic and other field preparations were in full swing by mid-October in the Hillsborough and Dade County producing areas, with transplanting beginning in Dade. Transplanting was underway in all producing areas by the end of October and was virtually complete by the end of November.

Light harvest was underway by late December in Dade County and by mid-January in the Hillsborough area. Supplies increased to peak volume in March. March shipments were 82 percent above the previous year. Most of the commercial harvest was completed by early May, and growers opened fields to the public for U-pic operations. Weather was generally favorable during the season, with only minor cold damage in January. Quality and size were generally good, although yields were somewhat below the previous year. Warmer weather in February and March resulted in heavy production during the peak season.

TOMATOES
1975-76

The total value of the Florida tomato crop for fresh and processing utilization continued upward last season. The $162.6 million was 9 percent above the previous season's record value. The factors contributing to the record value were a greater acreage and a slight increase in per unit value, which more than offset a reduction in average yield.

Total production of 30.8 million 30-pound carton equivalents was 8 percent above the previous season. The fresh market channel utilized 95 percent of the production, leaving 5 percent for processing. The Palmetto-Ruskin area accounted for 40.8 percent of the production; Dade County, 24.7 percent; the southwest, 20.1 percent and the Ft. Pierce-Pompano area, 13.6 percent. The remainder of the production was in the west, north, and north central areas.

The state average yield, at 765 (30-pound) cartons per acre, was down 90 cartons from the previous season. This decrease was primarily the result of a lower winter yield, which was due in part to losing the "hole in the donut" producing area in Dade County. This was high-yielding acreage, and its loss forced growers to shift to lower-yielding rockland. Dade County continues to supply the bulk of winter tomatoes. Fall shipments peaked in December, which accounted for 15.9 percent of the seasonal fresh market sales. Spring production reached a record high in May, which amounted to 23.6 percent of the seasonal total. Tomatoes were harvested continuously from late October to mid-June.

The Palmetto-Ruskin area continued to be the acreage leader, with 13,420 acres harvested. Dade County ranked second, harvesting 11,860 acres. The southwest harvested 7,170 acres, and the Ft. Pierce-Pompano area, 5,330 acres. A small acreage was harvested in the north, north central, and west areas.

Seeding and transplanting were underway in all areas in August. Hot, wet weather prevailed during September. Heavy rainfall occurred at mid-month, but damage was minimal. Mostly seasonal weather prevailed throughout the remainder of the fall season. Only minor cold damage occurred to the crop during the winter months. Disease problems reduced yields in some fields. Weather conditions were generally favorable for the spring season, although heavy rainfall in late May and early June hastened the completion of harvest in the Palmetto-Ruskin area. Some growers were unable to pick as many times as normal because of the frequent rains.

WATERMELONS
1975-76

Plantings of watermelons in Florida during 1976 totaled 55,000 acres, 38 percent more than 1975 and the largest acreage since 1961. Of this total, 55,000 acres were harvested, up 26 percent from the year before. During the 1976 season growers had the largest production of melons since 1966. The crop of 9.9 million hundredweight, was up 23 percent from the previous year. The average yield per acre for the season was 180 cwt., off 5 cwt. from last year.

The value of the crop totaled $25.8 million, second only to the record value of $35.2 million set during the 1975 season. The average price received by growers was slightly over 2.6 cents per pound, 1.8 cents less than the record price of 4.4 cents received in 1975. The low price was a major factor in the heavy abandonment of acreage during the 1976 season.

The watermelon season usually begins in the Ft. Myers-Immokalee area in late March or early April, depending on weather conditions. The season progresses into Central Florida during May while northern growing areas provide the heavy June volume. Harvest begins in June in the western or Panhandle area of the state and continues well into July.

Seeding was underway in the Immokalee area in mid-December. Land preparation was active in other parts of the southern and central areas for planting during late December and January. There was some damage to plants from cold weather in January and February, which delayed harvest until mid-April. By early May, melons were moving in good volume. Planting was complete in the central areas by the end of February. Cold weather caused some replanting. The crop progressed very slowly early in the season and harvest did not begin until late April. Harvest was in full swing by mid-May.

Planting was active in the north and west by mid-March. Dry weather in the northern areas slowed seed germination. The early plantings had poor stands and spot reseeding was necessary. In the Panhandle, there was some frost damage to early plantings in late March, requiring replanting of many fields.

Harvest got underway in the north in late May. Volume increased rapidly and reached a peak by mid-June. Size and quality of melons were very good but the price was low because of the heavy production in the state. Transportation was also a problem at this time due to the heavy demand for trucks.

In the west, the first melons were harvested the last half of June. Sales continued heavy into July with good volume moving from both the west and north. By the middle of July, harvest was completed in North Florida but shipments continued from the western growing areas through the last half of July. The volume declined sharply at the end of the month as the season finished.

Cantaloups are grown primarily in the southwest and north central areas of Florida. Much of the production sold goes through local markets or in bushel containers. Most of the crop is harvested in May and June. Availability of cantaloups begins in the southwest area and moves northward as the season progresses.

Researchers are working to develop several new varieties that will be adapted to Florida's soil and weather. There appears to be some promise along this line. See page 57 for shipments.

Cauliflower is available from mid-January into April. Supplies are grown primarily in the Ruskin and Zellwood areas. Light supplies are grown in the north.

Sub-tropical vegetables have expanded considerably in Florida in recent years. Commercial production began in the early 60's. Sub-tropical vegetable is a colloquial expression applied to certain vegetables eaten primarily by those of Latin American and Caribbean origin. The most common name for each is listed first with the scientific name second. Other common terms for the vegetables are rated third. The crops consist primarily of boniatos-ipomea batatos (sweet potato); calabaza-cucurbita (pumpkin); malanga-xanthosoma sagitaefolium (dasheen, yautias); and yuca-monihot esculenta (sweet cassava). Dade County produces the bulk of the sub-tropical vegetables. Miami is an important point of consumption for the Florida production. Also, a considerable amount is shipped to Tampa, New York City and Philadelphia.

Collard, turnip, and mustard greens are grown for both fresh and processing markets. Most of these commodities are grown primarily in the Everglades and north central areas. Good volume is available from late October through May, with the peak period being January through March. Greens for local markets are also grown adjacent to most of the large population centers of Florida.

Okra is grown in many areas of the state during the warm seasons of the year. However, Dade County produces okra during most of the year for local use as well as shipment to other markets. Good volume occurs March through June with April and May being the peak period. Generally good supplies are also available in October and November.

Green onions and leeks are produced in the north central area. Supplies are marketed primarily at local markets. Light supplies of dry onions are also available.

Parsley is available in both the curly and plain varieties. The bulk of the commercial supplies that are shipped out-of-state are produced in the Everglades and Zellwood areas. Light volume goes for local use and is available from the Sarasota and Lake Placid areas.

Southern peas are grown principally in the northwest, west central and Everglades areas of Florida. Dade County also produces good volume. Light supplies are available from September through December with heaviest movement during April through June. A high percentage of this crop moves to processors or through local markets.

Watercress is available year round. The major source of supply is Oviedo. Virtually all of the production is shipped to northeastern markets in the United States.

NOTE: Pompano interstate shipments of Mexican produce imported through Arizona and Texas border points, 1975-76 crop year. Cucumbers 157 carloads; eggplant 8; okra 9; English peas 4; peppers 4; squash 12; tomatoes regular type 15; cherry type 5; total 214 carloads. This data have not been previously reported in the above tables. There was an additional amount of West Mexico produce brought into Florida for sale within the state, especially tomatoes for Jacksonville, Plant City and Tampa repackers.
