United States Crops 1941-1942	e.

THE 1942 CROP SEASON

The fall sown grains for the 1942 harvest were seeded under rather unfavorable conditions. Rye and barley were seeded in September 1941 when the ground was relatively dry and wheat seeded after the average fly free date was seeded between the excessive falls of rain in October. The October rains and normal temperatures caused prompt germination and good growth though the plants remained tender. Frost was delayed until October 28th. December 1 condition was very near average. The first part of January 1942 brought sub-zero temperatures following several days when growing temperatures were reached during the day. The southern half of the state had a good cover of snow at the time of the sub-zero temperature but the northern part had only a very sketchy cover of snow. Sub-zero temperatures were reached in late February with little snow cover. Stands were thinned considerably in many fields. Damage from Hessian fly was greater than the delayed seeding of wheat seemed to warrant.

The loss of seeded acreage totaled 84,000 acres or 7.1 percent for wheat leaving 1,102,000 acres for harvest. Further loss of grain occurred because of wet weather at harvest so that only 12.5 bushels per acre were secured. The production of 13,775,000 bushels was the smallest for Indiana since 1928.

The barley acreage lost was 17,000 or 15 percent leaving 94,000 acres harvested. The yield of 24.0 bushels per acre was lower than expected because of harvest losses. Production was the largest in the history of the state because of the large acreage.

Rye acreage harvested for grain was 144,000 out of the 263,000 seeded. Most of the difference was due to other utilization as the yield of 13.5 bushels per acre is above average.

Spring crops had nearly normal precipitation in the early months and more than normal rainfall till late summer. Maximum temperatures from June to September averaged below normal and there were no extremely high temperatures. Minimum temperatures from March to August averaged more than one degree above normal. Freezing weather September 25 to 29 closed the season. The combination of abundant moisture and favorable temperatures resulted in excellent growth of all crops and pasture.

1940...Corn planting was 15 percent completed by May 14. Rains
1941...prevented further planting till May 25. From July 11 to 24 rains
1942...
June

again limited field work permitting weeds to get a good start in the corn. Mechanized equipment enabled farmers to remedy this situation except in a few poorly drained fields. The first part of July brought heavy rainfall which delayed small grain harvest. Considerable losses occurred from lodging and from weed growth which made it impossible to set combine cutter bars low enough to secure all the grain. Much hay was damaged by rain in June and July. The last three weeks of September and all of October were relatively dry and soybean harvest and corn husking made good progress. Wet weather in November interrupted the soybean harvest with a considerable part of the large acreage still standing in fields.

The aggregate crop acreage for 1942 was larger than 1941 by about 3 percent and slightly larger than the 1930-39 average. Increases were made in the acreages of corn, oats, barley, soybeans for beans, rye for grain, alfalfa hay and lespedeza hay. Some increase was made in the acreage of canning crops. Decreases were shown for wheat, cowpeas, clover and timothy hay, and soybean hay.

Crop yields for 1942 were very good. The yields of corn and soybeans were record breaking. Oats and barley were good even after loss in harvesting. Hay yields were above average though quality was impaired by rains at harvest. Truck crop yields were average or better. Fruit crops were only fair. Peach buds were killed in many sections in January and other tree fruits were affected by the heavy production of the previous season. Grass seeds fell somewhat short of average yields.

MINER M. JUSTIN, Sr. Agricultural Statistician.

ROBERT E. STRASZHEIM, Agricultural Statistician.

DONALD D. PITTMAN, Jr. Agricultural Statistician.

LIVESTOCK SUMMARY, INDIANA, JANUARY 1, 1942

In the year 1941 all classes of meat animals were increased from the numbers on hand January 1st. Larger numbers of chickens are on hand, but smaller numbers of turkeys than a year ago. Work animals, both horses and mules, were further reduced in numbers.

The number of horses declined by 23,000 head the past year to 303,000. This is the smallest horse population since 1867, and compares with the maximum of 854,000 about 1915. An inquiry on ages of horses made in July 1941 showed the average age of horses in Indiana to be 8.5 years, compared with 11.5 years in April 1933 and 10.4 years in February 1927. The largest age group in 1941 was the 3-4 year olds, while in 1933 it was the 11-12 year olds, and in 1927 the 9-10 year olds were most numerous.

Mules number 46,000 or 9,000 less than a year ago. This is the smallest number since 1869, and the largest recorded number for the state was 111,000 in 1916. The average age of mules in July 1941 was 10.9 years, where in April 1933 it was 11.3 years.

There are 87,000 more cattle than a year ago, and of these 38,000 are milk cows and heifers over 2 years old. The total of 1,822,000 head of cattle is the largest in 50 years, although milk cow numbers are not quite up to the level of 1934 and 1935. Abundant feed and good prices were the most important factors in the increases.

The 710,000 stock sheep are 34,000 more than a year ago but about one per cent below 1931-40 average. The number of sheep and lambs on feed January 1 was 161,000 with last year 166,000 and the 1931-40 average 186,000.

Hog numbers began to increase following the announcement of a supported price. The sows farrowing in the late spring of 1941 outnumbered those of 1940 although the decreased number in the early part of the farrowing season made the total number of 1941 spring litters smaller than in 1940. A high number of pigs per litter made the total spring pig crop 3 per cent larger than the previous year. The fall pig crop of 1941 was 6 per cent larger than in 1940. The net result was a 4 per cent increase in the hog inventory numbers for January 1, 1942 to 4,096,000 head.

Higher prices for eggs and chickens resulted in an increase of 9 per cent in chicken numbers to 16,545,000. The current inventory is only 2 per cent higher than the 1931-40 average. Turkeys on hand are 67,000 or 79 per cent of last year.

Values per head for all meat animals are sharply higher than last year, while work stock values have declined. The grand total livestock inventory value is \$227,252,000 which is 46 per cent more than last year and is 58 per cent above the 1931-40 average.

The 1941 wool crop was 5,242,000 pounds from 699,000 fleeces averaging 7.5 pounds. The fleece weight and production are slightly above the 1930-39 average but the number of fleeces is 12,000 less.

UNITED STATES

The number of livestock on farms increased sharply during 1941 and on January 1, 1942 the total for meat animals was the largest for all years and the increase in meat animals during 1941 was one of the three largest for all years. The number of horses and mules continued to decline, but the number of cattle, hogs and sheep increased, with cattle and sheep numbers both making new all time records and hogs reaching the fourth highest level in over 15 years.

The unusual increase in livestock numbers this year resulted from a conjunction of factors that tended to encourage increases in numbers of the different species. In the case of cattle the increase was largely a continuation of the up-swing in the cattle number cycle which goes up for 6 to 8 years and down for a somewhat similar period. The present cycle started upward in 1939 and the rate in 1941 was accelerated by relatively high prices of live animals and of milk and milk products and favorable feed conditions. With sheep the increase reflected relatively high prices for lambs and wool, a favorable lambing season in 1941 and very good feed and range conditions. In the case of hogs governmental actions of several kinds encouraged increased production which otherwise would not have occurred.

The largest relative increase was in the number of hogs, which was up about 12 per cent. This increase in numbers was a result largely of the large fall pig crop of 1941, which was up 18 per cent from that of 1940. There was, however, some increase in the number of hogs over 6 months old, exclusive of breeding stock, in the West North Central States but in all other areas the number of such hogs was below a year ago. The numbers of sows and gilts for spring farrow was up sharply in all regions. With the large number of hogs on farms January 1, 1942 and the prospective large increase in the 1942 spring pig crop the market supply of hogs in 1942 promises to establish a new record.

PIG CROP, SPRING OF 1942

As of December 1, 1941 the breeding intentions of Indiana farmers indicated 641,000 sows to farrow between December 1, 1941 and May 31, 1942. This is 20 per cent more than the 1941 spring litters and 45 per cent more than 1930-39 average.

TABLE XI. INDIANA: EGG PRODUCTION ON REPORTERS' FARMS, FLOCKS IN EXCESS OF 400 HENS AND PULLETS EXCLUDED. DATA FOR 1ST DAY OF MONTH.

* Preliminary.

Figures from 1910 on have been revised by comparing index of livestock prices with index of prices paid by farmers for commodities bought. Previous to 1910 livestock price indices were compared with index of wholesale prices of all commodities.

Before 1940, this series of data was published in the December issue of "Indiana Crops and Livestock."
