

APPLES

New England utilized apple production in 2008 totaled 4.1 million bushels (42-pound units), five percent above 2007 utilized output. Growing conditions for the 2008 apple crop were less than favorable in some areas of New England and very favorable in others. The crop survived the winter with few instances of winterkill due to record-breaking snowfall across the region. Cool, wet conditions in April led to poor pollination and increased instances of scab. May's cool, windy weather brought the season back

to normal in time for peak bloom. Warmer weather arrived in June and July, but much of New England was plagued by prolonged thunderstorms, leading to severe hail damage in four of the six New England states. Overall, producers rated the apple crop in good condition throughout the growing season. A preliminary grower estimate of expected price for the 2008 apple crop placed New England value of utilized production at \$84.4 million, 29 percent above the previous year's value. An updated estimate of value will be available July 8, 2009, after the majority of the 2008 crop has been marketed.

¹ Apple production from commercial orchards with 100 or more trees.

² Yield is based on total production, which includes unharvested production and fruit harvested but not sold due to market conditions.

³ Total production is the quantity actually harvested plus quantities which would have been acceptable for fresh market or processing but were not harvested because of economic or natural reasons.

⁴ Utilized production includes fruit sold, amount used on the operation or given away, and fruit placed in storage.

* Preliminary; final statistics for 2008 will be available July 8, 2009.
