2006 CDL Acreage Estimates vs. Official Estimates

Fractional Factorial Study, 2007

NASS See5 Method Test

- Test of seven variables.
- Establishes expected range of producer's accuracy.
- Identifies most important variables for optimization.

Fractional Factorial Study, 2007

Variable Levels per Run

Run	Variables						
	MODIS	AWiFS	Percent FSA Training	FSA Sampling Stratified Minimum Samples	Training Sample Points	NLCD Sampling Stratified Minimum Samples	Boost
1	1/2 MODIS	No Clouds	20	5	0.6Mp	10	7
2	MODIS	No Clouds	20	2	0.4Mp	10	10

NLCD St. Min. Samples	36.9	39.7	46.8	46.3	37.3	37.6	51.6	44.1	-0.233
Boost	39.7	37.3	51.6	46.3	36.9	37.6	44.1	46.8	2.353

Fractional Factorial Study, 2007

Optimization of FSA Training

Fractional Factorial Study, 2007

FSA Training Study, Percent Correct

Crops	Range of Percent FSA Training		
	10-90	20-90	50-90
Mean Major Crops (StDev)	93.5 (0.902)	93.7 (0.422)	94.0 (0.148)
Mean All Crops (StDev)	76.4 (1.979)	76.9 (1.176)	77.7 (0.383)
Mean Peanuts+ S.Potatos (St Dev)	48.8 (4.711)	50.0 (3.041)	52.0 (0.917)

Fractional Factorial Study, 2007

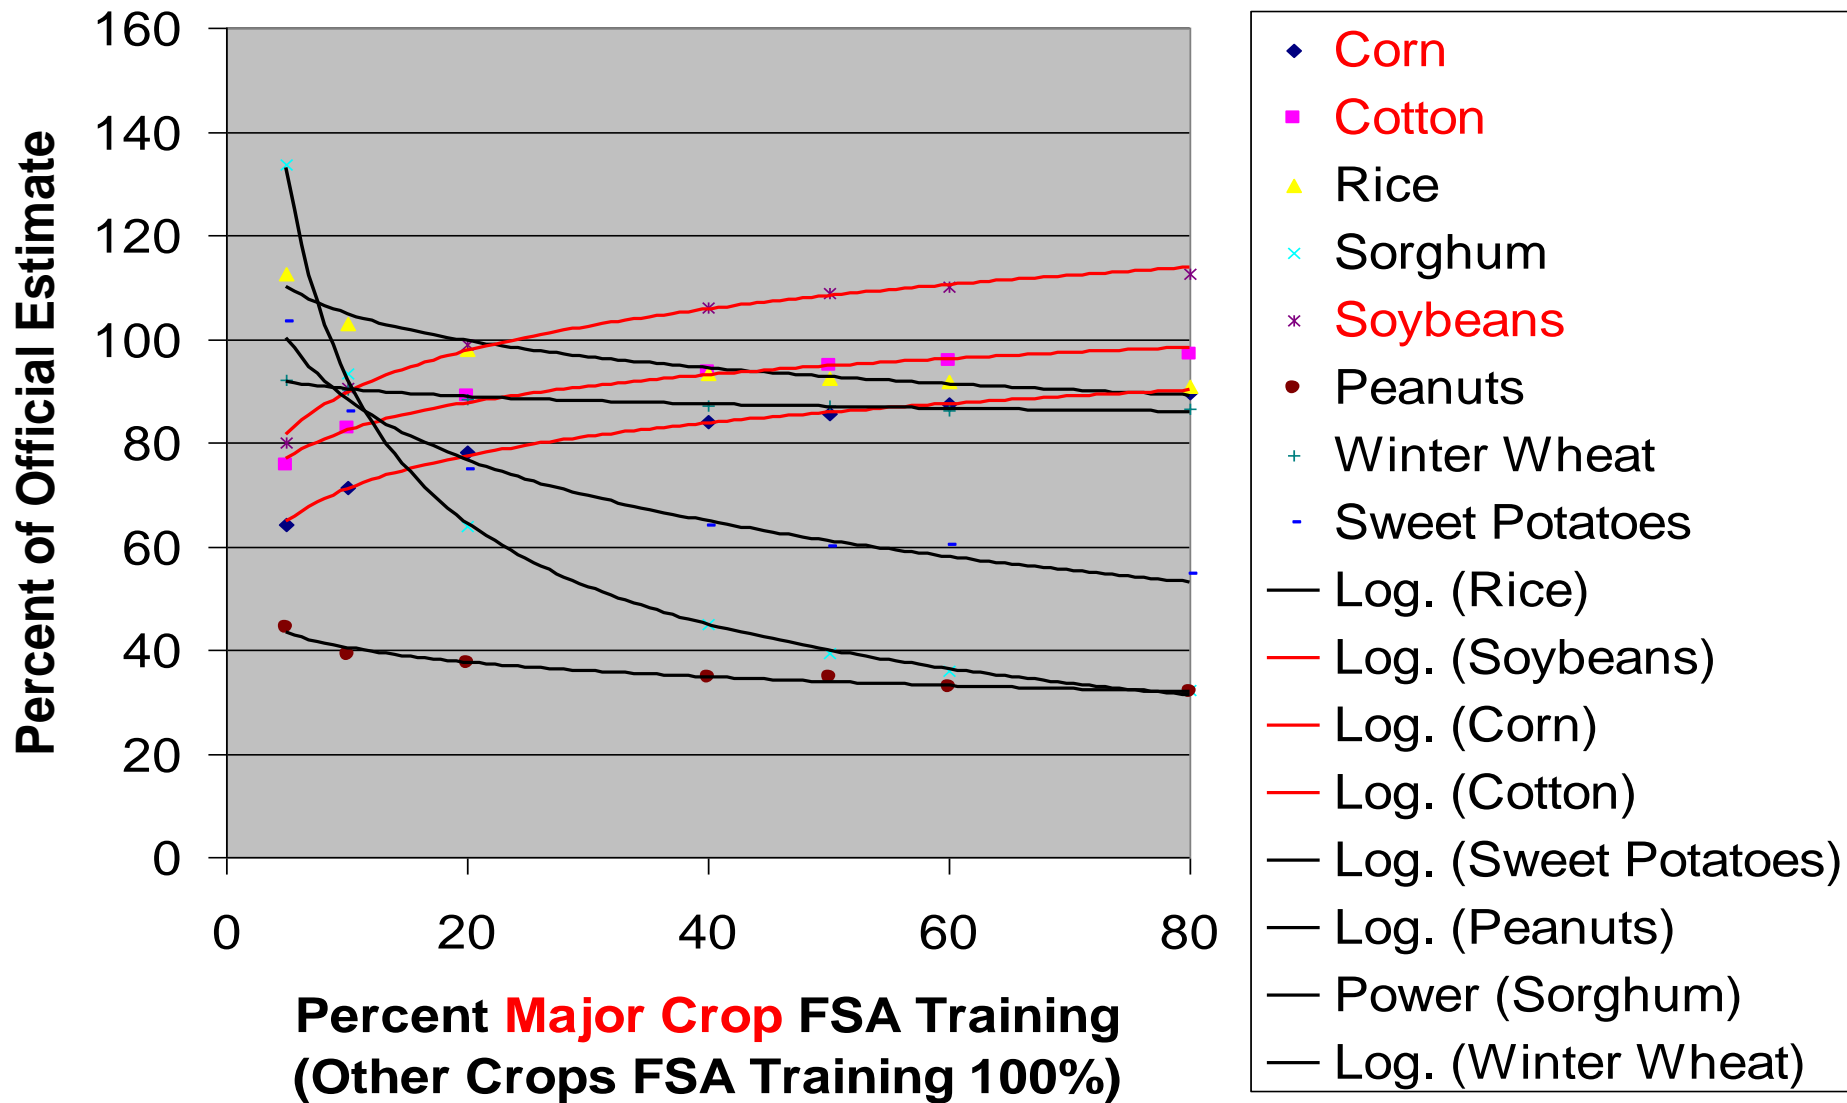

Results

- Over the extreme range settings for the seven parameters varied, the mean producer's accuracy for the major crops was 92.8% with a standard deviation of 0.735.
- The most important parameter is the FSA training.
- Optimization of the FSA training gave an improved mean producer's accuracy of 94.0% and a standard deviation of 0.148 for the major crops.
- Minor crops require further optimization.

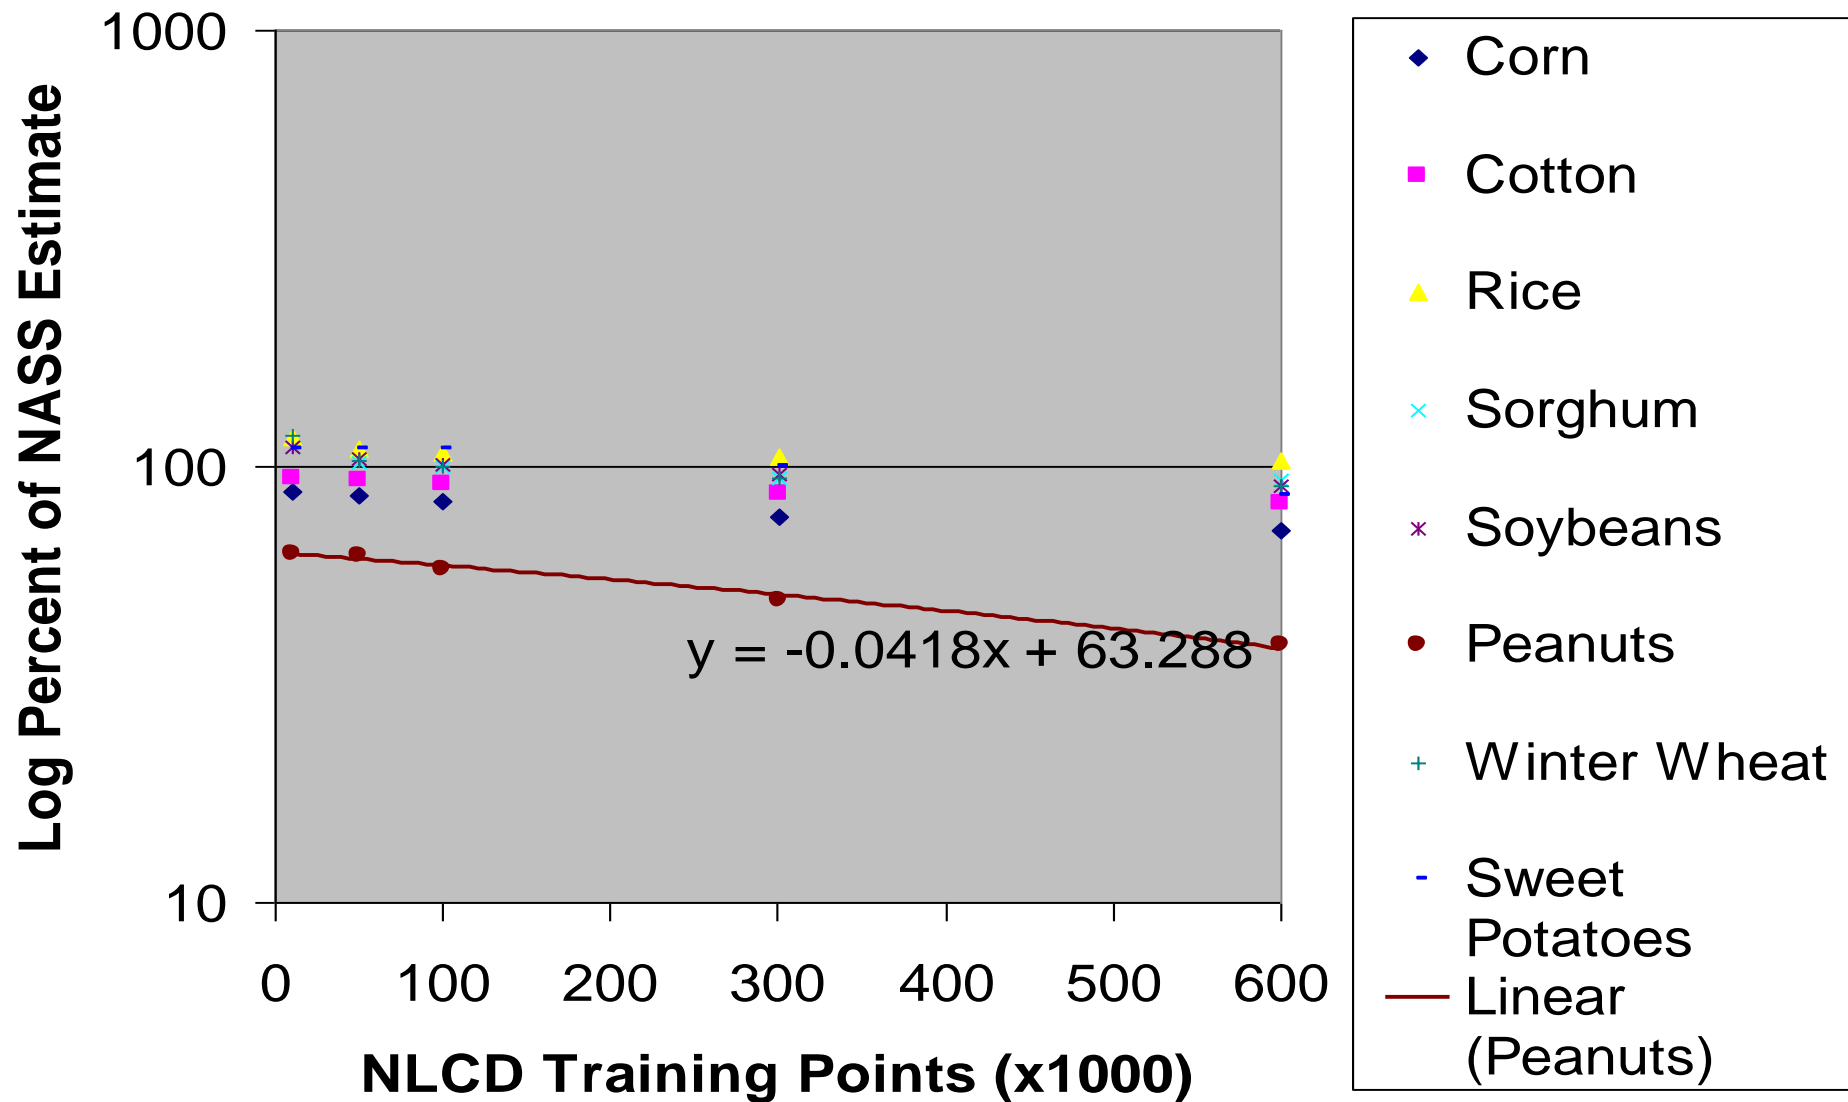

CDL 2007 Crop Acre Accuracy Retrospective Study vs. Official Results

- Pixel acre comparisons vs. official estimates.
- Study of optimization of parameters, starting with % FSA training.
- Main goal of the study is to improve performance of the classifier for low acreage crops and obtain an optimized CDL representative of all crops.

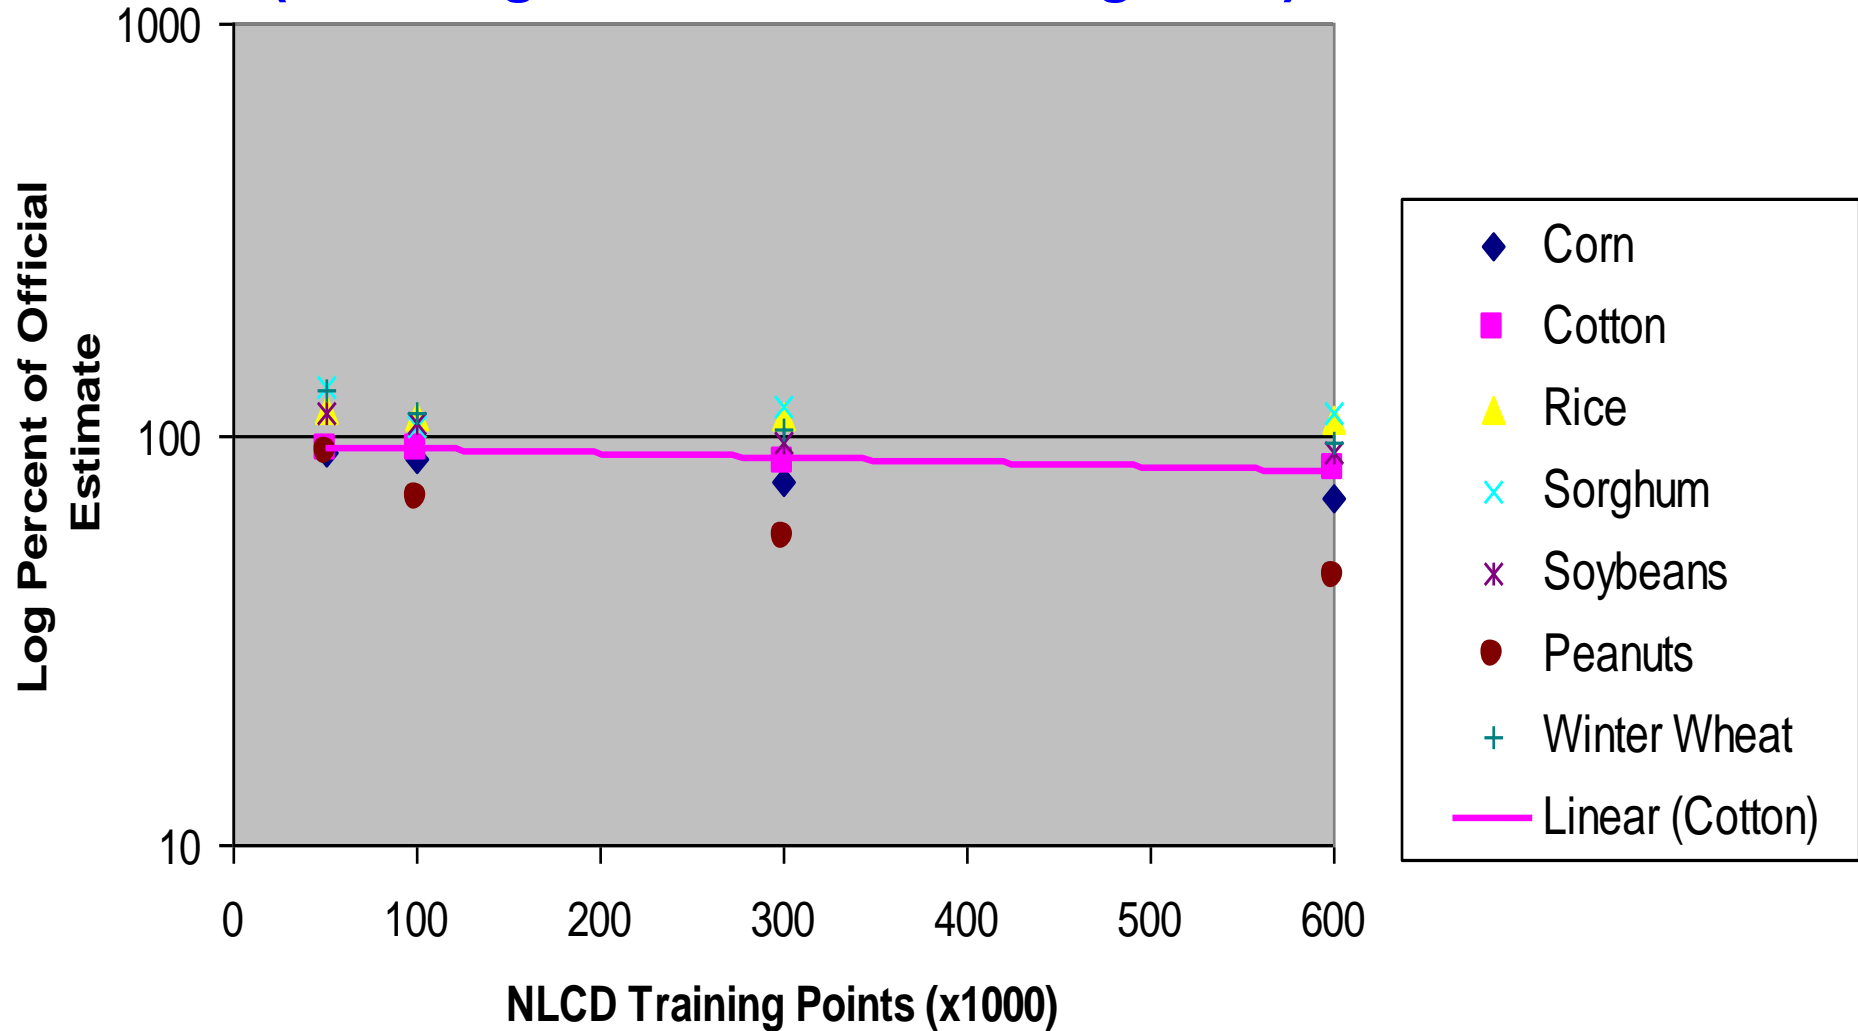

CDL 2007 Crop Acre Accuracy vs. Major Crop Training Data

CDL 2007 Crop Acre Acuracy vs. NLCD Training Points

CDL 2007 Crop Acre Accuracy vs. NLCD Training Points (Deleting Selected FSA Categories)

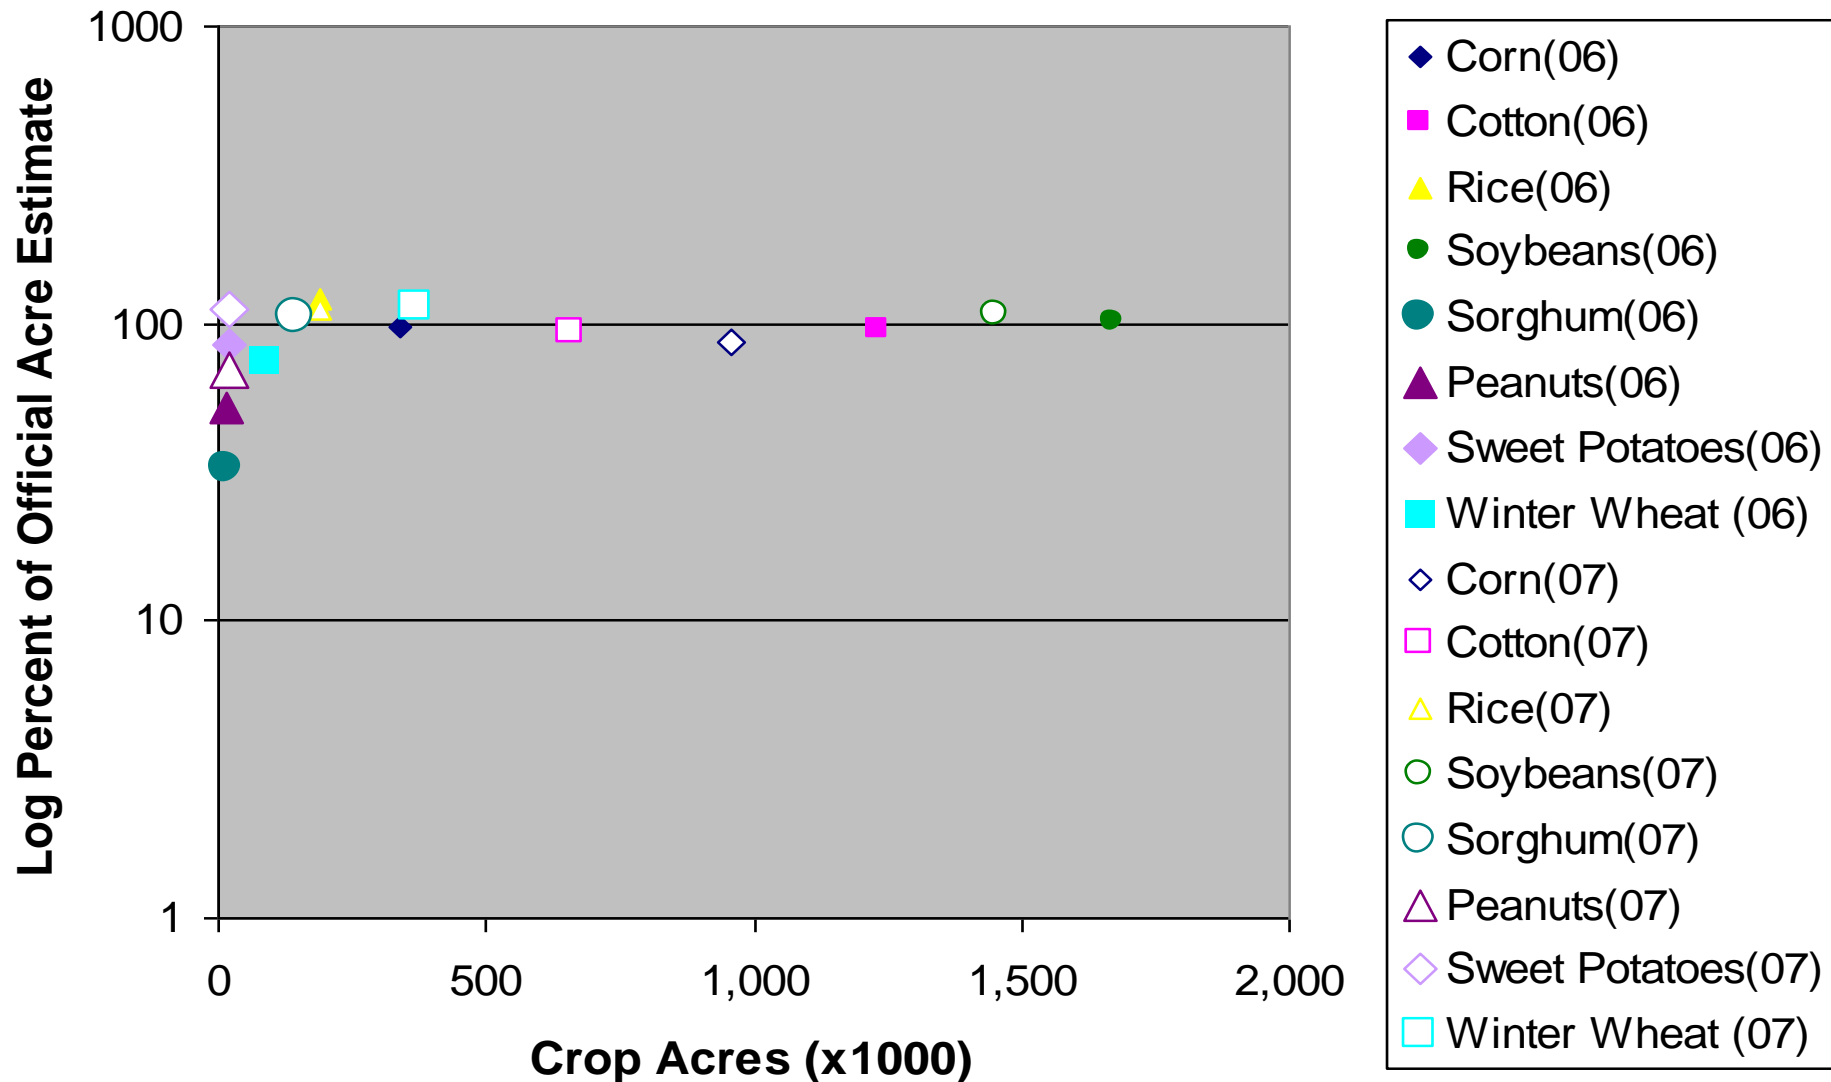

CDL 2007 Crop Acre Accuracy Results

- Splitting the FSA training allows reduction of the major crops training relative to the minor crops and (with the exception of peanuts) improves the estimates for minor crops.
- Improvement for peanuts resulted from reducing the number of NLCD training points.
- The best overall results were obtained by reducing (a) the NLCD training points, (b) the major crop percent FSA training, and (c) the FSA categories.
- The final optimized 2007 CDL gave a mean result for pixel acres 100% of the official estimate with a standard deviation of 15.5. The peanut estimate was improved to 70% of the estimate. An optimized 2006 CDL was also produced using a similar method.

Crop Acre Accuracy vs. Acres Published 2006/2007 Mississippi CDLs

Crop Acre Accuracy vs. Acres Optimized 2006/2007 Mississippi CDLs

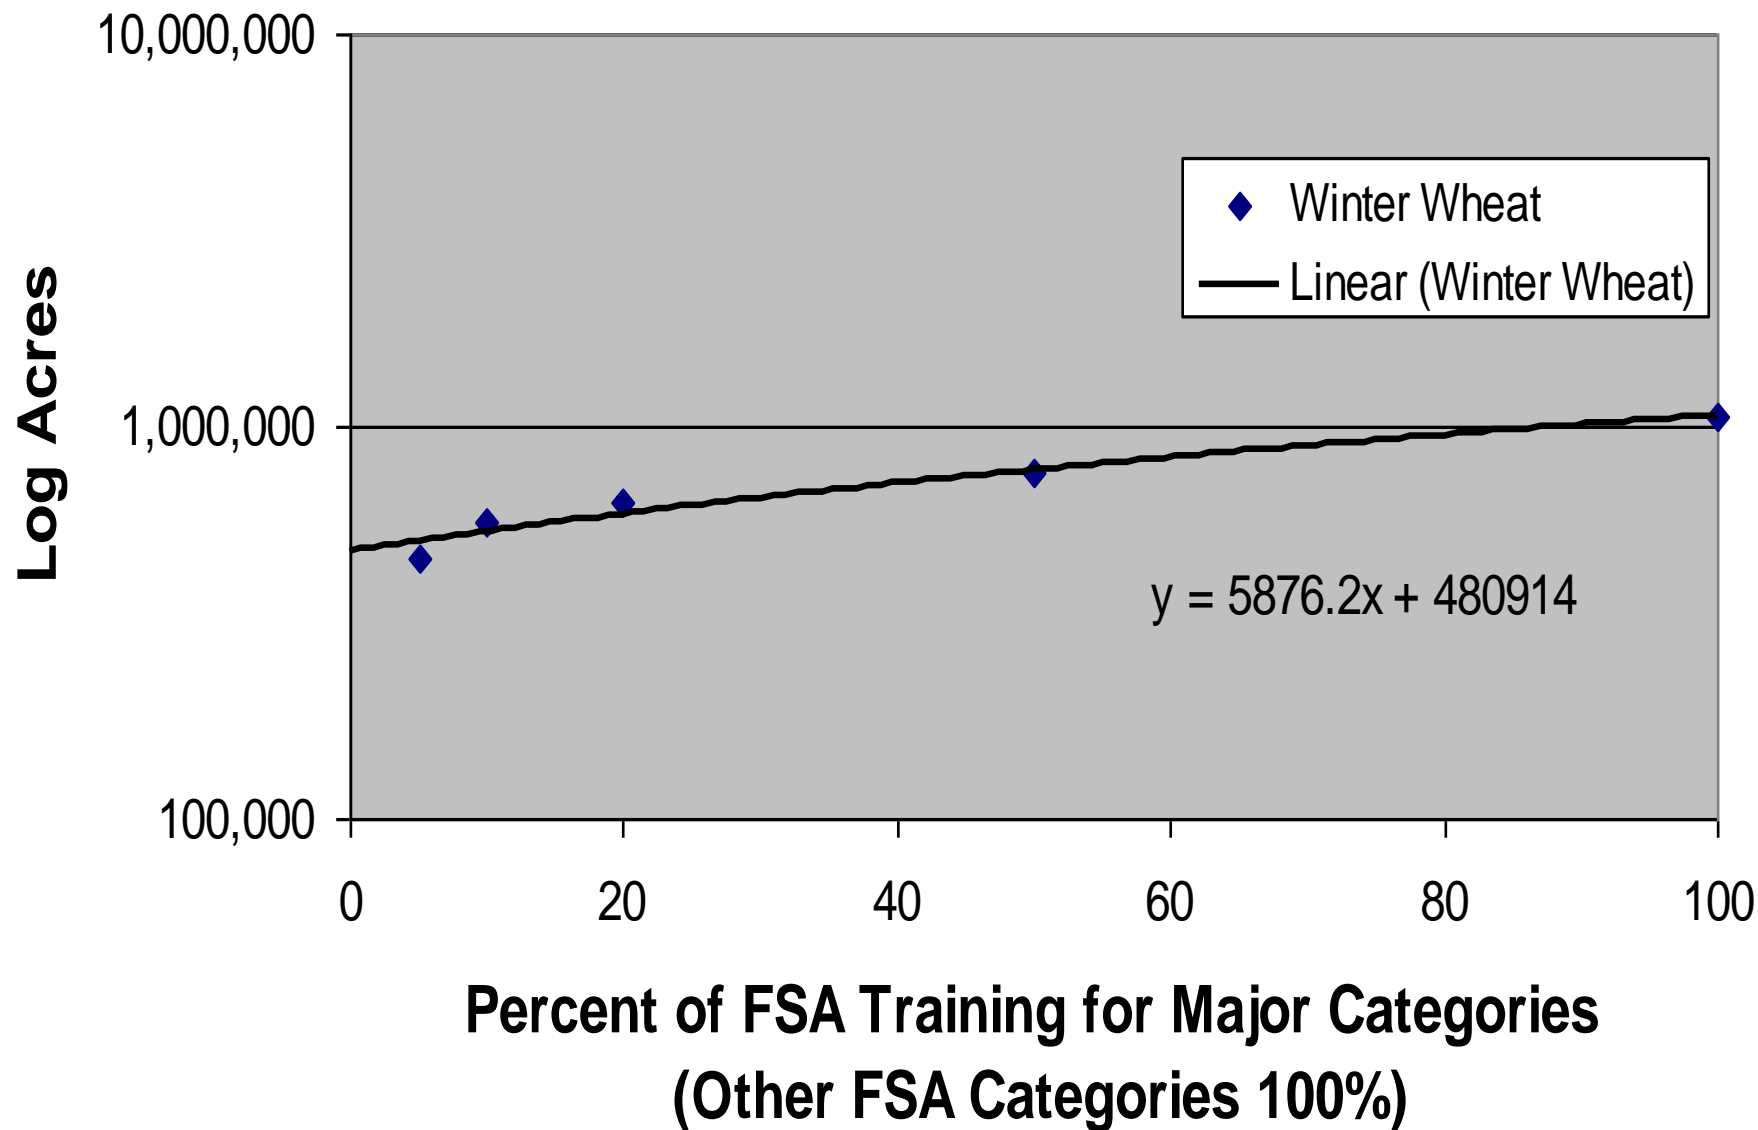

Winter Wheat Study, 2008

The First Mississippi Early Summer Remote Sensing Estimate

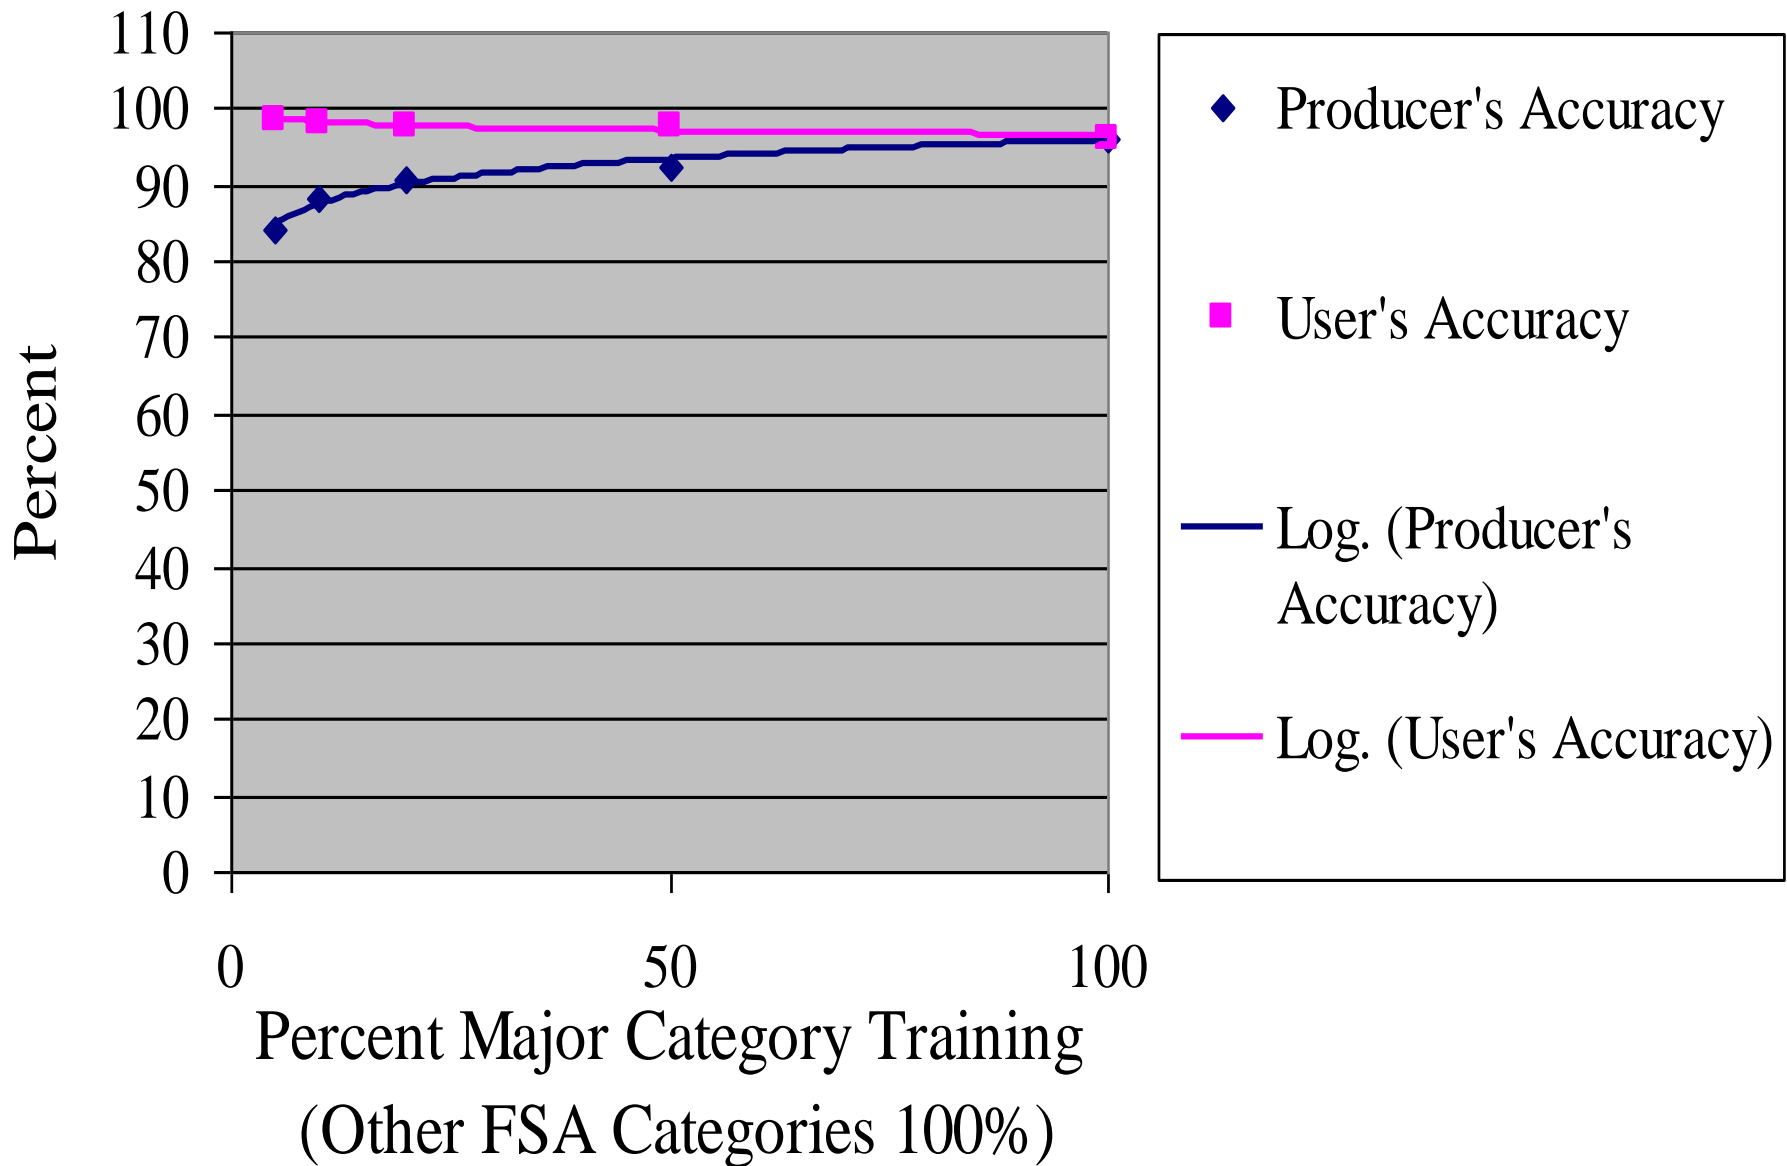

- Great AWiFS imagery covering the entire state twice in 3 mosaics. Very early dates for most crops (last date May 19).
- Great winter wheat FSA training data. FSA training data for other crops was very sparse and is absent for the north 1/3 of the Delta.
- Study varied the FSA training and used extrapolation to zero training acres.
- Tested producer's and user's accuracy.

Winter Wheat Study, 2008

Acres vs. FSA Training Data for Major Categories

Producer's and User's Accuracy for 2008 Winter Wheat Study

Winter Wheat Study, 2008

Results

- The estimate was prepared by June 12, 2008, before the June release of the official estimate.
- Extrapolation to zero FSA winter wheat training gave a planted acre estimate of 96.2% of the official estimate.
- The wheat acres decreased in a logarithmic fashion by a factor of >2 as the FSA major category split training was decreased to zero.
- The producer and user accuracies changed in opposite directions as the major category FSA training was lowered with an average accuracy always greater than 90%.

Discussion

- Testing the NASS See5 Method with a fractional factorial study over a wide range of parameter settings, generally gives excellent producer and user accuracy and acreage estimates for the major crops.
- The FSA training is most important in improvement and can be modified by splitting the training and reducing the categories with the most training pixels.
- The NASS See5 Method has been optimized with a method to include accurate minor crop estimates using adjustment of (a) the percent FSA training, (b) the NLCD training, and (c) the FSA categories used.
- An additional extension of the NASS See5 Method was required for winter wheat estimation. Training data at the required early date was not available for major crops causing a serious over estimate by the standard method. However, extrapolation of a semi-log plot to zero FSA training gives a winter wheat acreage result unbiased by overfitting.
