Corn Belt. In the Central and Northern Corn Belt approximately a half of the farms are in the range of 140 to 260 acres, with nearly a fourth of the farms larger than 260 acres and the remaining approximate one-fourth of the farms smaller than 140 acres.

For the Corn Belt, in 1954, the average size of eash-grain farms was 226 acres and the average size of livestock farms was 231 acres. For the United States as a whole the average acreages for these types were 380 acres and 731 acres, respectively. The considerably larger average sizes of these types for the United States results from the inclusion of large wheat farms of the Great Plains and the Northwest in the cash-grain group and the inclusion of the large western ranches in the livestock group. The relatively moderate average sizes of these two types of farms in the Corn Belt are rather striking in comparison with the averages for the United States. Of interest also is the close similarity in average size of cash-grain farms and livestock farms in the Corn Belt.

The similarity in size of these two types of farms in terms of acreage is portrayed by the data in table 13. The similarity in distribution of acreage size groups in the two types is strongly consistent in all the regions of the Corn Belt. The only minor difference apparent is that a slightly larger proportion of the livestock farms than of the cash-grain farms is composed of farms under 30 acres in size, but the actual number of farms of either type in this small size group is relatively few (table 14).

The distribution of farms in each economic class among the specified acreage size groups is shown for cash-grain farms and livestock farms in tables 14 and 15. The acreage size groupings are the same as those of the foregoing tables. The 140 to 179 acre group is centered around and includes all the quarter-section (160 acres) farms, which were the typical homestead size. The gradual trend to larger acreages per farm is reflected in the fact that 46.5 percent of the commercial farms are larger than the quarter-section unit, while only 33.8 percent of the farms are smaller than 140 acres. It also reflects the fact that forces inducing farmers to enlarge their farms have been greater or more prevalent than the forces tending toward dividing the farmland among the heirs of successive generations as has been the case in many of the older countries of the world.

The progress of mechanization which has brought about the possibility of one operator handling an increasing acreage of cropland with less labor is the most influential factor making for farm enlargement, but it is significant also that there has been no great increase in the number of farms of 500 acres and over. This group is still a small percentage of the total. The typical farm in the Corn Belt is the family-size farm, although its acreage is now generally larger than it was in homestead years or even only a generation ago.

TABLE 14.—NUMBER OF COMMERCIAL FARMS IN EACH ACREAGE SIZE GROUP, IN THE CORN BELT: 1954

Type and economic class of farm	Number of farms by acreage size group								
	All sizes	Under 30 acres	30 to 69 acres	70 to 139 acres	140 to 179 acres	180 to 259 acres	260 to 499 acres	500 to 999 acres	1,000 acres and over
