## 1991-92 CALIFORNIA VALENCIA ORANGE FORECAST

The 1991-92 Valencia orange forecast for all California is 56.0 million (37.5 pound) cartons based on the November Objective Measurement (OM) Survey.

## SURVEY HISTORY

A Valencia Orange Objective Measurement (OM) Survey, funded by the Valencia Orange Administrative Committee (VOAC), has been conducted in southern California since the 1984-85 crop year. The survey has been conducted in the central valley since the 1985-86 crop year. Both areas were surveyed in November. The data were used for research purposes until the 1986-87 season. This current

forecast was made using OM data and the subjective probability citrus survey of grower production and yield. OM data from the 1990-91 crop year were not used due to the freeze.

## SURVEY SAMPLE

A sample of approximately 193 blocks was completed in the central valley and 194 blocks in southern California. The sample was randomly selected proportional to county and variety bearing acreage. Once a grove was randomly chosen and permission granted, two trees were randomly selected. Trunk and branch measurements along with fruit counts were then made on each tree. Size data are collected by the VOAC with their regular monthly Tagged Fruit and Growth Survey.
