

2004 California Processing Tomato Report

Released: September 1, 2004

CALIFORNIA AGRICULTURAL
STATISTICS SERVICE

2004 PROCESSING TOMATO PRODUCTION

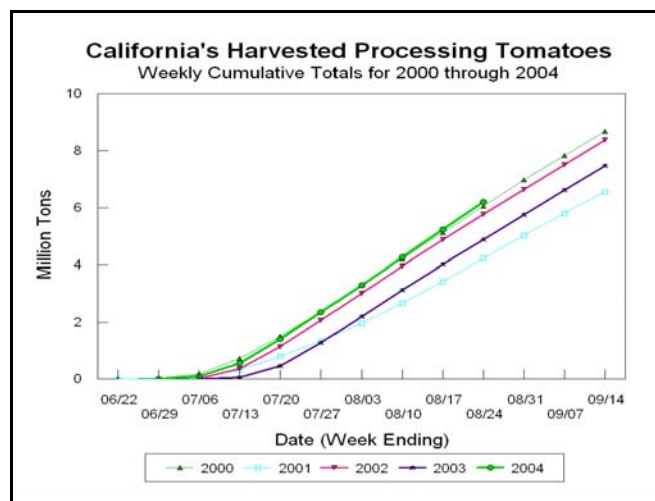

As of August 15, 2004, California's contracted processing tomato production is forecast at 11,100,000 tons, up 1 percent from the May forecast and 21 percent higher than the 2003 season. Processors expected this production to come from 281,000 acres producing an average 39.50 tons per acre.

This forecast was funded by the California League of Food Processors, in cooperation with the California Department of Food and Agriculture. The USDA forecast for U.S. processing tomato production will be issued on September 3.

Warm weather accelerated crop progress in early spring and harvesting began earlier than usual in many areas. Crop conditions have generally been excellent. Problems with weeds and insect pests were reported to be at or below typical levels this season. Vigorous plant growth was noted during the first weeks of summer and exceptionally high yields have been reported in most growing regions. Because of the heavier than expected production, industry sources report that a portion of the crop may remain unused and that some processors are planning to purchase significant quantities in addition to the tonnage that was contracted.

As of August 21, the total Statewide inspected tonnage of tomatoes delivered (6,203,599 tons) was 27 percent higher compared to the same time one year ago.

This report is based on the results of a survey conducted in August. This particular survey asked processors for the amount of tomatoes they expect to process and the total harvested acreage required to achieve that amount.
