All Hay		73,033,000	1.67	121,924,000	Ton	18.10[5]	2,207,973,000
Alfalfa Seed		832,200	178[3]	147,999,000	Cwt.	27.50	40,761,000
Sweet Clover Seed		147,200	177[3]	26,112,000	Cwt.	8.45	2,207,000
Sudangrass Seed		67,500	497[3]	33,540,000	Cwt.	4.74	1,589,000
Field Peas[4]	227,000	203,000	1,219[3]	2,475,000	Cwt.	5.02	12,418,000
Broomcorn	241,100	201,100	350[3]	35,000	Ton	251.00	8,769,000
Popcorn	253,200	234,040	2,069[3]	484,202,000	Cwt.	2.41	11,663,000
Apples, Commercial Crop				124,717,000	Bu.	1.86	229,289,000
Peaches				70,120,000	Bu.	1.92	130,832,000
Pears				28,774,000	Bu.	2.29	65,809,000
Cherries, Sour				85,760	Ton	167.00	16,985,000
Cherries, Sweet				101,660	Ton	287.00	24,629,000
Apricots				108,200	Ton	161.00	17,359,000
Cranberries		20,920	53.9	1,127,000	Bbl.	[7]	13,236,000
Grapes				2,950,270	Ton	[7]	194,917,000
Oranges and Tangerines				126,635,000	Box	[7]	407,263,000
Grapefruit				42,500,000	Box	[7]	59,964,000
COMMERCIAL VEGETABLES							
Asparagus, for Mfg.		107,230	1.04	111,200	Ton	193.50	21,521,000
Asparagus, for Market		50,680	26	1,315,000	Cwt.	12.84	16,886,000
Beans, Snap, for Mfg.		151,060	2.42	365,800	Ton	111.40	40,745,000
Beans, Snap, for Market		128,250	35	4,511,000	Cwt.	8.13	35,608,000
Cabbage, for Mfg.		12,180	16.9	205,900	Ton	11.40	2,352,000
Cabbage, for Market		119,685	178	21,253,000	Cwt.	1.86	39,531,000
Cantaloup		135,250	92	12,436,000	Cwt.	3.96	47,558,000
Carrots		68,410	215	14,734,000	Cwt.	2.84	41,509,000
Cauliflower		29,850	149	4,454,000	Cwt.	3.71	16,532,000
Celery		35,920	390	13,996,000	Cwt.	4.50	62,939,000
Sweet Corn, for Mfg.		385,460	3.43	1,322,400	Ton	18.80	24,802,000
Sweet Corn, for Market		209,250	63	13,246,000	Cwt.	3.40	44,413,000
Cucumbers, for Pickles		119,060	3.00	356,800	Ton	53.30	19,005,000
Lettuce		223,210	148	33,000,000	Cwt.	4.02	130,804,000
Onions		107,060	219	23,499,000	Cwt.	2.68	61,493,000
Peas, Green, for Mfg.		377,900	1.28	484,500	Ton	88.20	42,747,000
Peas, Green, for Market		8,400	28	237,000	Cwt.	8.06	1,869,000
Spinach, for Market		31,250	54	1,675,000	Cwt.	6.57	11,001,000
Tomatoes, for Mfg.		337,050	12.6	4,257,700	Ton	25.50	108,591,000
Tomatoes, for Market		214,100	87	18,582,000	Cwt.	6.44	116,128,000
Watermelons		456,850	79	36,147,000	Cwt.	1.05	33,152,000
Total Commercial Vegetables		3,628,995[6]					1,025,582,000[6]
Total All Principal Crops		321,109,000[6]					18,823,192,000[6]

[1]Includes quantities of some crops not marketed and excluded in computing values.
[2]Planted for all uses.
[3]Pounds.
[4]Production, price and value on clean basis.
[5]Price of hay sold baled.
[6]Includes some crops not shown separately.
[7]Not available.

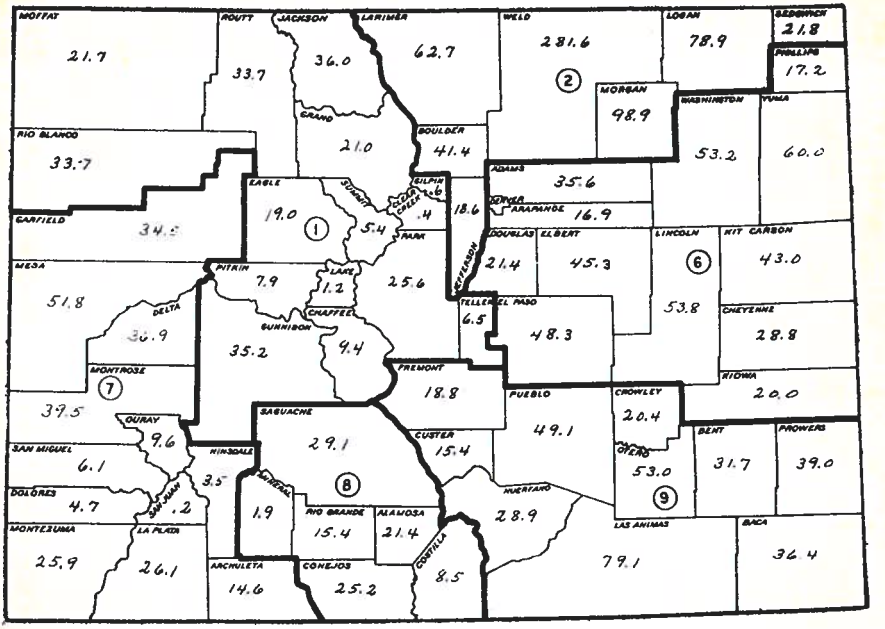
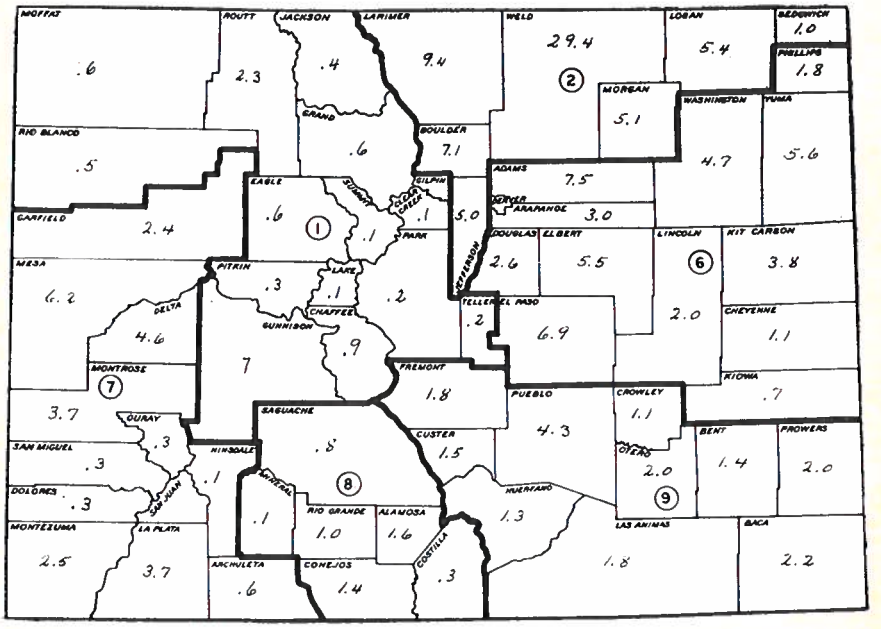
ALL CATTLE AND CALVES ON FARMS JANUARY 1
Average Number 1954-1958
(1,000 Head)



COWS AND HEIFERS OVER TWO YEARS OLD KEPT FOR MILK
Average Number on Farms January 1, 1954-1958
(1,000 Head)



HOGS AND PIGS—There were 221,000 hogs on farms January 1, 1959 compared with 170,000 a year earlier. Numbers on January 1, 1959 were above the preceding 6 years but below all other years since 1913 and less than one-third of the 1944 peak. Average values were up from $27.40 per head on January 1, 1958 to $30.40 for January 1, 1959.

PIG CROP—The 1958 pig crop in Colorado totaled 281,000 head in comparison with 238,000 head in 1957 and the 1947-56 average of 352,000 head. The number of pigs saved in 1958 was more than for any year since 1952. However, the pig crops were larger than 1958 in each of the years 1924 through 1952 (except 1935). The record high of 961,000 head occurred in 1943. The average number of pigs saved per litter reached a new record high of 6.9 pigs compared to 6.8 pigs in 1957 and the 1947-56 average of 6.3 pigs. There was a gradual rise in pigs saved per litter from 5.1 in 1924 to 6.9 in 1958.

The 1958 spring pig crop in Colorado (December 1957 through May 1958) was estimated at 150,000 head. This was 16,000 head or 12 percent more than the 1957 spring pig crop and the largest spring pig crop since 1952. The 1947-56 average spring crop was 200,000 head. The average number of pigs saved per litter at 6.8 during the spring of 1958 exceeded all other years on record. Sows farrowing totaled 22,000 head compared to 20,000 head the spring of 1957 and the 1947-56 average of 32,000 head.

A little less than half of the total 1958 pig crop, or 131,000 head, was accounted for by the fall pig crop. There were 19,000 fall sows farrowed, 1,000 more than intentions in June. This was 27 percent more than the 15,000 fall sows in 1957 but 18 percent below the 10-year, 1947-56, average. Pigs saved per litter at 6.9 was the same as the fall of 1957 but above the 10-year average of 6.5. Fall farrowings were spread more evenly between months in 1958 than in 1957 although they still peaked in September. Monthly distribution was as follows: June, 14.1 percent; July, 14.6 percent; August, 20.1 percent; September, 24.5 percent; October, 17.5 percent; and November, 9.2 percent. Feed supplies in Colorado were plentiful and the market for hogs was quite strong.

HORSES AND MULES—Horse and mule numbers continued their downward trend during 1958 with the 67,000 on hand January 1, 1959, 2,000 less than on January 1, 1958. Average value at $106.00 compared to $76.00 the year before and reflected the increased proportion of riding stock. (About two-thirds of the horses in Colorado are saddle horses and cow ponies.)

CHICKENS AND EGGS—Chickens on farms January 1, 1959 totaled 1,876,000 birds, 47,000 more than the 1,829,000 on January 1, 1958 which was the lowest number of record (starting in 1929). The value per bird on January 1, 1959 was $1.05, the same as for each of the three preceding years. The total valuation of $1,970,000 was slightly more than the $1,920,000 for January 1, 1958, but was less than the $2,100,000 on January 1, 1957.

The number of layers on hand during the year continued the long term decline and averaged 1,547,000 compared to 1,629,000 for 1957. The number of eggs per layer averaged 191 during 1958 which equalled the record number produced per layer in 1956. The average number per layer in 1957 was 190. Annual production of eggs totaled 296,000,000 in 1958 compared to 310,000,000 produced in 1957, and 335,000,000 in 1956 and was the lowest annual production since 1938.

TURKEYS—The number of turkeys raised continued to increase during 1958 to a record total of 1,326,000, a 12 percent increase over the previous record crop of 1,184,000 in 1957. The 1947-56 average was 779,000 birds.

The January 1, 1959 inventory number was 30,000 turkeys compared to 24,000 the year before. The value per bird decreased to $5.00 on January 1, 1959 from $5.20 on January 1, 1958. However, because of the increase in numbers, the total valuation was $150,000 compared to $125,000 the year before. Turkey breeder hens on hand January 1, 1959 numbered 8,000, the same as the year before but 2,000 below the number on January 1, 1956 and only a fraction of the record number of 92,000 hens on hand January 1, 1940.

Sheep wintered in very good condition throughout Colorado. Most of the 1957-58 winter sheep ranges were open to grazing during the winter with good feed. There were no prolonged storms but cool, wet weather during lambing in the spring of 1958 resulted in a few unusual losses of new born lambs. In sections of western Colorado some heavy ewe losses were reported in the spring due to poison weeds. Growth of spring grass was delayed by cool, wet March and April weather but development was rapid as temperatures warmed. Early summer grass was excellent throughout the state. Lambs made very good weight gains due to abundant feed. Dry conditions for several weeks in low elevations of western Colorado dried grass prematurely and reduced prospects for fall grazing in a number of Western Slope areas.

SHEEP AND LAMBS ON FEED FOR MARKET—There were 527,000 sheep and lambs in Colorado feedlots January 1, 1959, compared with 504,000 a year earlier. Although the number was larger than a year earlier, feeding was still on a comparatively low level. On January 1, 1957, 550,000 lambs were in feedlots and in the early 1950's the number was even larger. (Colorado maintains its position as the "Number One" lamb feeding state for the fourth successive year.) The increase in 1958 was almost entirely in northern Colorado where the total was 380,000 head compared with 340,000 head on January 1, 1958 and 377,000 head on January 1, 1957. In the Arkansas Valley only 125,000 head of lambs were on feed January 1, 1959 against 140,000 January 1, 1958. The number of lambs January 1 in both of these areas would have been greater, but due to the unusually early in-movement, marketings during December for finish and weight reasons were unusually large. Miscellaneous areas, principally the San Luis Valley and lower western valleys, accounted for the remaining numbers on feed. Combining the number of lambs on feed in northern Colorado and the number fed in the North Platte River Valley of Nebraska and Wyoming, the total was 560,000 on January 1, 1959 compared with 534,000 head January 1, 1958.

Lambs moved into the principal Colorado feeding areas much earlier in 1958 than in 1957 but at generally lighter weights. This was a reflection of the somewhat poorer feed conditions over the western range sheep country during 1958 compared with the unusually favorable conditions which prevailed in 1957. Lambs moved into the feeding areas in the fall of 1958 at approximately $2.00 per head higher than in the fall of 1957 and feeders were faced with a very discouraging fat lamb market. In some instances fat lamb prices were not returning original cost. It was a favorable fall for grazing beet fields and using other field crop residue. This was in sharp contrast with the wet fields and late beet harvest in 1957.

LAMB CROP—The Colorado lamb crop for 1958 was estimated at 1,028,000 head, 6 percent above 1957 and 2 percent above the 10-year, 1947-56, average of 1,004,000 head. This was the first increase in the lamb crop since 1954. A record-high lambing percentage in the spring of 1958 was responsible for the larger lamb crop. There were 100 lambs saved per 100 breeding ewes one year old and older on hand January 1, 1958. The lambing percentage was 94 in 1957 and the 1947-56 average was 95 percent.

Breeding ewes on hand January 1, 1958 in Colorado totaled 1,028,000 head, the same as for January 1, 1957. The 1947-56 average number of breeding ewes on hand January 1 was 1,057,000 head.

WOOL—Production of wool in Colorado during 1958 amounted to 11,884,000 pounds, 7 percent above the 1957 production of 11,155,000 and 6 percent above the 1947-56 average of 11,222,000 pounds. The 1958 wool crop was the largest since 1946, but was only 77 percent of the record high of 15,458,000 pounds in 1943.

There were 1,298,000 head of sheep and lambs (including feedlot lambs) shorn in 1958 in comparison with 1,243,000 head in 1957 and the 10-year average of 1,234,000. Average fleece weight in 1958 was 9.2 pounds and in 1957 was 9.0 pounds. Value of the 1958 wool crop was placed at $4,516,000 (excluding incentive payments) based on the average price of 38 cents a pound received for wool sales from April 1958 through January 1959. The 1957 wool crop averaged 52 cents a pound and had a valuation of $5,801,000. The average valuation for the 1947-56 period was $6,047,000 and the record high of $11,580,000 was received from the 1951 wool crop for which an average of $1.00 per pound was received. Government wool incentive payments are not included in above price and valuation figures.

520,000 head on January 1, 1958. The number of steers over 1 year old increased to 248,000 head on hand January 1, 1959 compared to 188,000 a year earlier; however, most of this increase was in steers in feed lots with 136,000 on feed for market compared to 90,000 the year before. Average January value per head for all cattle was $158.00 January 1, 1959 compared to $123.00 the year before, $82.00 two years before and the record high of $177.00 reached in 1952. Total value of all cattle was $341,122,000 January 1, 1959, $243,417,000 on January 1, 1958 and $161,868,000 for January 1, 1957. The all time record high was $371,346,000 on January 1, 1952.

CATTLE IN FEEDLOTS—There were 293,000 head of cattle and calves being fattened in Colorado feedlots January 1, 1959. This number was 17 percent above the 251,000 head on feed January 1, 1958 and was up seasonally from the 228,000 head the preceding quarter (October 1, 1958). The January 1, 1959 number on feed was at the highest level for the first of the year since January 1, 1953 when 296,000 head were in feedlots. The high number was a continuation of the high feeding level established early in the year plus the usual seasonal uptrend for the winter feeding season. Feed was abundant at favorable prices to cattle feeders and fat cattle prices held up well during the fall of 1958.

Data on kind of animals on feed in the state on January 1, 1959 showed 144,000 steers and steer calves, 145,000 heifers and heifer calves and 4,000 "other" cattle. There were 90,000 steers, 134,000 heifers, 24,000 calves and 3,000 "other" cattle on feed January 1, 1958.

Weight information for cattle and calves on feed revealed the same number of heavy cattle (weighing over 1100 pounds) January 1, 1959 as a year earlier—18,000 head. In the 900 to 1100 pound group there were 71,000 head January 1, 1959 against 63,000 head the year before. Cattle and calves weighing less than 900 pounds totaled 204,000 head compared to 170,000 head January 1, 1958.

Reports from cattle feeders on length of time cattle had been in feedlots January 1, 1959 showed more animals than on January 1, 1958 in each of the three length of feeding time categories. The numbers January 1, 1959 and January 1, 1958, respectively, by time on feed were: On feed less than three months—180,000 and 148,000 head; on feed three to six months—104,000 and 99,000 head; and on feed more than 6 months —9,000 and 4,000 head.

MILK COWS AND HEIFERS—The number of cows and heifers 2 years old and over kept for milk continued to decrease with 147,000 on farms January 1, 1959 compared to 153,000 a year earlier, the 1948-57 January 1 average of 180,000 head and the 1934 record high of 300,000. The January 1, 1959 inventory was the lowest since 1913. Average value per head was $231.00 compared to $183.00 on January 1, 1958.

CALF CROP—Calves born in Colorado during 1958 totaled 780,000 head which was 4 percent more than the 753,000 head in 1957 and 2 percent more than the 1947-56 average of 765,000 head. The 1958 calf crop was exceeded in only four years—1952 through 1955—with the record high of 873,000 head in 1954. There were 857,000 cows and heifers 2 years old and older on January 1, 1958 compared to 846,000 on January 1, 1957 and the 10-year average of 881,000 head. The record high number of total cows was reached January 1, 1954 with 981,000 head on hand. Calves born as a percentage of cows and heifers 2 years old and older on hand the first of the year was 91 in 1958, 89 in 1957 and 87 for the 1947-56 average. Production of range and pasture feeds, hays, roughages and feed grains was large in 1958 and calves developed well. The number of calves still held in herds January 1, 1959 was record high and was an unusually large percentage of the total calf crop.

SHEEP AND LAMBS—Stock sheep numbers were estimated at 1,302,000 head on January 1, 1959, the largest since 1946. The January 1, 1958 stock sheep inventory was 1,252,000 head and the 1948-57 average was 1,255,000. Favorable range feed conditions and large feed crops during the preceding two years encouraged some restocking. Mature ewes increased from 1,028,000 head January 1, 1958 to 1,069,000 head on January 1, 1959. Ewe lambs totaled 186,000 head on January 1, 1959, 181,000 one year earlier and 144,000 two years earlier. Average value per head for all sheep was $23.00 on January 1, 1959 compared to $21.90 a year earlier and total value was $42,061,000 compared to $38,504,000 for January 1, 1958.

LIVESTOCK INVENTORY AND VALUE

January 1, 1959 and 1958

The total meat animal inventory in Colorado was larger on January 1, 1959 than on January 1, 1958. The number of all cattle and calves increased 9 percent, hogs 30 percent and stock sheep 4 percent. The number of cattle in feed lots was 17 percent larger and sheep and lambs being fed in dry lots was up 5 percent. Milk cow numbers were down 4 percent, and horse and mule numbers continued their long decline with 3 percent fewer animals on farms and ranches January 1, 1959 than on January 1, 1958. The chicken inventory rose 2.6 percent and the turkey inventory increased 25 percent. Feed supplies on ranges and from feed crops were large during 1958. Many ranchers restocked herds and flocks which were reduced during the drought period. In addition, good profits a year earlier and current abundant stocks of feed resulted in a strong demand for feeder stock. Values per head January 1, 1959 were higher than on January 1, 1958 for all species except chickens and turkeys. The aggregate value of all livestock (including cattle and sheep on feed) and poultry January 1, 1959 was $399,123,000 and the second highest of record. This was $105 million, or 36 percent, above the January 1, 1958 inventory value of $293,868,000. For the 1948-57 period, the average January 1 inventory valuation was $282,822,000 and the record high of $449,772,000 occurred in 1952.

ALL CATTLE AND CALVES—Cattle and calf numbers in Colorado (including cattle on feed) totaled 2,159,000 head on January 1, 1959 and was near the record high of 2,161,000 in 1953. The January 1, 1959 level was 9 percent above the revised estimate for January 1, 1958 of 1,979,000 and was also 9 percent above the 1948-57 average of 1,973,000 head. Milk cows were at the lowest level since 1913 and beef stock at the highest level ever reached in the state. Beef cows increased from 704,000 on January 1, 1958 to 754,000 January 1, 1959 but were still less than the record high of 804,000 head on January 1, 1954. Beef heifers 1–2 years old registered a new record high of 297,000 head compared to 285,000 a year earlier (excluding the number on feed, there were 166,000 head January 1, 1959 and 151,000 the year before). Calves (other than heifer calves kept for milk) increased 11 percent to a record high of 578,000 head compared to

[1]Data for 1954-56 are taken from the August, 1957 issue "Survey of Current Business" published by the U. S. Dept. of Commerce, under the heading "Personal Income by States and Regions." For detailed explanation of these estimates, see text in August, 1957 issue "Survey of Current Business," pp. 11-21.

[2]Compiled from Mineral Yearbook of the U. S. Bureau of Mines for the years concerned. Reported values were rounded to the nearest thousand dollars for ease of presentation and comparability with other income data.

[3]In addition to minerals shown separately this total includes primarily molybdenum, vanadium, tungsten, natural gas together with sand and gravel and a number of other minerals of lesser importance. Individual data on some minerals are not included for security reasons.

[4]Unavailable.

NOTE—For a discussion of the significance of this table, see page 4 of Colorado Agricultural Statistics, 1950.

[1]Includes stocks in interior mills, elevators, warehouses, commercial stocks at terminals and those owned by Commodity Credit Corporation in storage under CCC control.

[2]Year shown refers to year of storage. For example: The 1,738,000 bushels shown as in storage January 1, 1952, was produced in 1951 or earlier.

[3]Does not include stocks in merchant mills or bins owned by Commodity Credit Corportion.

[4]Unallocated—to avoid disclosing individual operations.

[1]In certain years, production includes some quantities not harvested because of economic conditions and excluded in computing value.

[2]Estimates of commercial apples relate to production in 7 commercial counties (Larimer, Delta, Garfield, Mesa, Montezuma, Montrose and Fremont), which produce about 95 percent of the total apples produced in the state.

[1]Harvested acreage of oats includes acreage cut ripe and fed unthreshed prior to 1949. Beginning in 1949 estimates include only acreage threshed or combined.

[2]Planted for harvest in year shown. Winter wheat sown fall of preceding year.

[3]Only harvested acreage estimates are made for these crops.

NEG. 497-57 (6) AGRICULTURAL MARKETING SERVICE

A significant feature of the 1958-59 onion deal was the heavy early movement into marketing channels. Shipments prior to January 1, 1959 were one-third larger than in the same period a year earlier and stocks on January first were less than one-fifth of the crop. It is also worthy of note that, despite the continued heavy marketings, prices advanced progressively each month to attain the highest level since 1952.

LETTUCE—In addition to holding second place of importance in Colorado's total vegetable output, the 1958 lettuce deal also ranked second in volume of production among the Nation's Summer Lettuce states. A harvested area of 6,000 acres yielded 900,000 cwt. valued at only $897,000 compared with 6,000 acres, 750,000 cwt. and $3,038,000 in 1957. The 1949-56 average was 4,380 acres, 482,000 cwt. and $1,204,000. A most revealing observation is that, although growers produced 20 percent more lettuce in 1958 than in 1957, they realized 70 percent less financial returns. This comparison tells the story of a most disappointing lettuce deal. Growers and shippers in the San Luis Valley had gone all out in concerted efforts to make Colorado a major source of the Nation's Summer Lettuce supply. Improved growing and handling practices, installation of seven vacuum cooling chambers, together with a newly established grade standard all proved of no avail on a glutted market in 1958. The expected demand for Colorado lettuce did not materialize and most shipments were on special order, with some consignment billing, often at prices below the actual harvesting and handling costs. Consequently, a large portion of excellent quality lettuce was never harvested. The low total crop value was derived by applying prices received to that portion of the crop which was harvested and sold.

CABBAGE—This third ranking Colorado vegetable crop also holds third place among the country's Late Summer group of 10 states in volume of production. This year's 2,700 acres produced 648,000 cwt. valued at $688,000 against 2,700 acres, 702,000 cwt. and $889,000 in 1957. The 8-year average was 3,340 acres, 808,000 cwt. and $1,004,000. Insect damage reduced yields sharply on early cabbage in northern Colorado.

TOMATOES—Tomatoes grown for fresh market and for processing in 1958 retained their fourth place rating in Colorado's vegetable output with a combined production of 568,000 cwt. worth $1,024,000. The bulk of this crop is utilized for processing which in 1958 amounted to 418,000 cwt. from 2,900 acres with a farm value of $522,000 compared with 432,000 cwt., 2,400 acres and $510,000 in 1957 and 504,000 cwt., 3,200 acres and $607,000 the 1949-56 average. The 1958 fresh market crop totaled 150,000 cwt. worth $502,000 against 144,000 cwt. and $526,000 a year earlier, and 170,000 cwt. and $605,000 average.

CUCUMBERS—In 1958 cucumbers produced for pickles on 1,800 acres totaled 320,000 cwt. valued at $866,000 which compares with 1,900 acres, 341,000 cwt. and $1,031,000 in 1957 and 2,600 acres, 283,000 cwt. and $835,000 the 8-year average.

CARROTS—A harvested area of 1,900 acres in 1958 yielded 276,000 cwt. with a farm value of $1,021,000. In 1957, 1,900 acres produced 285,000 cwt. worth $1,425,000. The 1949-56 average was 1,650 acres, 211,000 cwt. and $631,000.

CANTALOUPS—This year's 2,500 acres produced 225,000 cwt. appraised at $439,000 against 2,500 acres, 212,000 cwt. and $456,000 in 1957 and 2,190 acres, 196,000 cwt. and $383,000 average.

SNAP BEANS—Production of snap beans grown for processing in 1958 totaled 126,000 cwt. with a farm value of $543,000 while the fresh market crop amounted to 35,000 cwt. and $273,000. In 1957 the canning crop of 104,000 cwt. brought $506,000 to growers and the fresh market output of 35,000 cwt. was worth $308,000.

OTHER VEGETABLE CROPS—Acreage harvested and production respectively for 1958 compared with 1957 are as follows: CAULIFLOWER: 900 acres and 140,000 cwt. for both years. CELERY: 400 acres and 122,000 cwt. in 1958 compared with 450 acres and 112,000 cwt. in 1957. SWEET CORN for fresh market: 3,400 acres and 221,000 cwt. against 2,800 acres and 182,000 cwt. GREEN PEAS for fresh market; 1,400 acres and 39,000 cwt. against 1,600 acres and 40,000 cwt. SPINACH: 1,600 acres and 80,000 cwt. compared with 1,300 acres and 52,000 cwt. in 1957.

in the aggregate quantity of vegetables produced. An equally favorable showing is observed for crops grown for processing, with the State ranking 26th in acreage and 18th in volume of production.

A significant observation is that growers in 1958 produced 6 percent more vegetables from 5 percent more acreage for which they received 10 percent less money than in 1957. This poor financial showing resulted from lower prices per cwt. received in 1958 for 12 crops. In fact, prices received for 10 crops were even below the average of recent years, which is in sharp contrast to rising costs of producing the crops. Lettuce was the most disappointing vegetable deal in 1958 and was mainly responsible for the low financial status of the season. On the other hand, onions were the money crop in 1958 and kept the total values from dropping to a much lower level. Fresh market crops were mostly responsible for raising the 1958 production level above that of 1957. The area harvested for fresh market in 1958 was only 4 percent larger while production was 7 percent greater than in 1957. On the other hand, an 8-percent larger acreage harvested for processing this year yielded only 1 percent more vegetables.

Early season backwardness, caused principally by hail and hard rains, was generally offset by favorable growing conditions during the latter half of the season. Yield per acre prospects improved progressively throughout the late months and the final outcome was above average yields for 12 of the 15 vegetables included in the regular program of estimates. Even though final returns for 1958 reflected a favorable season generally, growing conditions over the state were less uniform than in 1957. The contrast was most pronounced in the Arkansas Valley. The heaviest crop losses were suffered in an area extending from La Junta eastward to the state line, where approximately 700 acres of onions and 400 acres of cantaloups were completely destroyed by hail and hard rains, and yields were sharply reduced in remaining fields. West of La Junta yields were generally good to excellent, although there were some local acreage and yield losses in this section of the Valley also. The weather was generally favorable in the San Luis Valley except for hot dry winds in July which brought the green peas to maturity too rapidly for orderly marketing and caused tip burn on lettuce, of which harvest had been delayed by a sluggish market. In northern Colorado there was considerable variance between certain areas but most crops yielded well. There were relatively small losses from hail and hard rains, and insects reduced the yield somewhat on early cabbage. Good yields were obtained on onions on the Western Slope, but yellow blight caused heavy losses of tomato acreage and reduced yields on the acreage picked.

ONIONS—The 1958 onion crop of 2,184,000 cwt. amounted to 36 percent of the total quantity and 40 percent of the total value of all commercial vegetables grown in the State. Colorado also commands a strong position of importance on the national scope by producing 13 percent of the country's fall and winter onion supply. In volume of production Colorado has moved up into third place among the 19 states in the Late Summer group—only 2 percentage points below second place California. The preliminary value of the 1958 crop was estimated in December at $5,460,000. In 1957 production of 2,044,000 cwt. was appraised at $4,088,000 and the 1949-56 average was 1,813,000 cwt. worth $4,029,000. An area of 7,800 acres was harvested in 1958 compared with 7,300 acres in 1957 and 7,640 acres the 8-year average. Compared with 1957, the acreage harvested in 1958 was up 14 percent in northern Colorado and 3 percent in the Arkansas Valley but unchanged on the Western Slope. Arkansas Valley growers planted 15 percent more acreage in 1958 than a year earlier but abandonment was greater than usual. The Colorado 1958 onion crop was beset by several adverse growing conditions. Early in the season, hail, hard rains, crusting and insect damage resulted in the largest acreage abandonment since 1951 and retarded growth in many fields not completely destoyed. By mid-season mildew and purple blotch had become more extensive than in any recent year. But these backward fields made marked recovery in September while undamaged fields made high yields. Also, an exceptionally late fall resulted in the addition of considerable tonnage in October. The final outturn was an average yield per acre equal to that of the two previous years—the second highest of record. October weather was ideal for harvesting and, although shrink losses were heavy on some lots, the crop as a whole went into storage in excellent keeping condition.

SORGHUMS—A grain sorghum crop of 12,454,000 bushels was harvested, second only to the 1957 record crop of 16,400,000 bushels. The 1947-56 average was 3,050,000 bushels. Forage production amounted to 268,000 tons compared to 762,000 tons in 1957 and 324,000 tons average. Silage production was estimated at 175,000 tons compared to 562,000 tons the previous year and 75,000 tons average. The total acreage of sorghums planted at 836,000 acres was near average but only half the record 1957 plantings. A larger than usual proportion of the total was on irrigated land, most of which was harvested for grain. Both irrigated and non-irrigated grain sorghums yielded well and the state average of 26.0 bushels per acre topped 1957 by 6.0 bushels and the 10-year average by 13.8 bushels. Much non-irrigated acreage was planted late but the fall was ideal for maturing and harvesting a larger than normal portion of the total.

BROOMCORN—Production of broomcorn was 5,600 tons compared to 11,200 tons harvested in 1957 and 7,380 tons average. The acreage harvested at 49,000 acres was the smallest since 1939. This compares with 80,000 in 1957 and 70,000 the 10-year average. Much of the acreage was planted very late with little hope of maturing. Favorable October weather allowed 68 per cent of the planted acreage to make brush. Harvest weather was ideal.

SEED CROPS—Alfalfa seed production was estimated at 2,400,000 pounds in 1958 in comparison with the 1957 crop of 2,030,000 pounds and the 10-year average of 2,954,000 pounds. Production of **sweetclover seed** amounted to 1,350,000 pounds compared to 1,400,000 pounds the previous year and 1,967,000 pounds average. **Sudangrass seed** production at 7,150,000 pounds was down sharply from the 1957 bumper crop of 43,460,000 pounds and was also less than the 1947-56 average of 8,304,000 pounds. Acreage was down from 106,000 to 26,000 and yield was off one-third.

HAY CROPS—A total of 2,628,000 tons of all hay was harvested in 1958 compared to the 1957 crop of 2,886,000 tons and the 1947-56 average of 2,285,000 tons. Growing conditions and yields were better than average with the all hay yield averaging 1.79 tons per acre in comparison with the 1957 record high of 1.90 tons per acre and the 10-year average of 1.62 tons per acre. Harvest weather favored better quality than in 1957. Over two-thirds of the total was alfalfa. A large quantity of hay was carried over from the 1957 crop.

FRUIT—Production of all fruits except sour cherries was above average in 1958. **Peach** production was estimated at 1,820,000 bushels compared to 1,850,000 in 1957 and 1,707,000 bushels average. Lygus bug damage to peaches was more prevalent than usual and excess cullage was estimated at 273,000 bushels. The **commercial apple** crop amounted to 1,520,000 bushels. This was larger than both 1957 with 1,120,000 bushels and average with 1,307,000 bushels. The **pear** crop was 225,000 bushels compared to 165,000 bushels in the previous year and 195,000 bushels average. The **sweet cherry** crop of 1,100 tons was near the record high and sharply above the 1957 harvest of 420 tons as well as the 10-year average of 623 tons. **Sour cherry** production at 1,770 tons fell below the 1947-56 average of 2,160 tons but was above the 1957 crop of 1,550 tons.

COMMERCIAL VEGETABLES

(1958 Season)

The usual high level of production was maintained through the 1958 season but growers failed to receive comparable financial remuneration for their investment, ingenuity and labors. A total of 40,070 acres of vegetables grown for fresh market and for processing yielded an aggregate production of 304,300 tons valued at $13,660,000. In 1957, 38,090 acres produced 288,300 tons worth $15,233,000. The 1956 area harvested was 37,910 acres, production was 288,200 tons and the farm value of these crops was $13,684,000. The 1958 vegetable output was the largest since 1950 when 312,400 tons were taken from 50,770 acres. It is interesting to note, however, that it required 27 percent more acreage to produce 3 percent more vegetables in 1950 than in 1958. Producers have learned to cope with the widely diversified conditions encountered at altitudes ranging from 3,500 to more than 8,000 feet above sea level. The commendable level of productivity obtained by Colorado growers becomes quite obvious when compared with other states. For the third consecutive year Colorado ranks 15th among the states in the total acreage harvested for fresh market but places 9th

lodging extensive, harvest was difficult but yield and quality were mostly excellent. Abandonment in 1957 was 28 per cent and the 10-year average was 30 per cent. Yield per acre at 25.5 bushels was the highest ever secured and was 1.0 bushel above 1957 and 9.9 bushels above average. **Spring wheat** production continued at a low level with only 1,004,000 bushels against 1,144,000 bushels in 1957 and 1,751,000 bushels the 10-year average.

POTATOES—A crop of 13,505,000 cwt. of potatoes was harvested in 1958. This record high production compares with 10,857,000 cwt. in 1957 and the 1949-56 average of 10,328,000 cwt. The **fall potato** crop (for market after October 1) amounted to 10,557,000 cwt. in comparison with 8,482,000 cwt. in 1957 and 8,080,000 cwt. for the 1949-56 average. With favorable weather, planting was completed at an early date. Irrigation water supplies were adequate and growing conditions favorable. Killing frost was later than normal and potato size was large, contributing to the record high yield of 230 cwt. per acre. There were 45,900 acres of fall potatoes harvested compared with 43,500 acres in 1957 and the 1949-56 average of 43,600 acres. Quality was good and potatoes went into storage in very good condition. The government diversion program was again in effect for diverting potatoes to livestock feed. The **late summer potato crop** totaled 2,948,000 cwt. compared to 2,375,000 cwt. in 1957 and 2,248,000 cwt. the 1949-56 average. Planting and growing conditions were favorable with the exception of some spotted hail damage. The yield averaged 225 cwt. per acre, close to the 1949-56 average of 223 cwt. Low prices retarded harvest and this resulted in increased yields. Low prices also caused unusual cullage.

SUGAR BEETS—Sugar beet production totaled 2,389,000 tons compared with 2,399,000 tons in 1957 and the 10-year average of 1,896,000 tons. The average yield of 16.8 tons per acre was 0.9 tons less than in 1957 but 1.3 tons above the 1947-56 average. Wet weather slowed planting and some replanting was necessary. Summer development was very good with the exception of the western Colorado acreage where white fly and attendant curley top were prevalent. Clear, warm weather most of October and November favored harvest which was completed earlier than usual.

DRY BEANS—Dry bean production was estimated at 1,820,000 bags (100 pounds clean basis) compared to 2,063,000 bags harvested in 1957 and 1,897,000 bags average. Yield of all beans averaged 740 pounds per harvested acre, well below the 955 pounds in 1957 and also below the 10-year average of 792 pounds. In 1958 irrigated beans averaged **1470** pounds and non-irrigated beans **375** pounds. There were 246,000 acres of beans harvested, 14 per cent more than in 1957 with two-thirds of the acreage on non-irrigated land. The 1958 crop in southwestern Colorado was only half as large as the total harvested in 1957. A substantial increase in acreage was recorded in the southeastern section and yields were fair. Irrigated beans in northern Colorado made a good start although some of the acreage was late as a result of replanting. Growth during the summer was good but rust and blight reduced yields on some irrigated beans late in the season. Harvest weather was favorable. A late fall allowed some late acreage of doubtful outturn in the southwest to reach maturity.

OATS AND BARLEY—Production of oats was 4,582,000 bushels in comparison with 6,336,000 bushels in 1957 and 5,016,000 bushels average. Part of the acreage was planted late, and warm, dry weather limited the average yield to 32.5 bushels, 3.5 bushels less than in 1957. **Barley** production was 12,900,000 bushels compared to 18,208,000 bushels in 1957 and 11,347,000 bushels the 10-year average. Winter barley accounted for a larger than usual portion of the total and yielded very well while spring barley, particularly on non-irrigated land, made a poor showing.

CORN—Corn production totaled 26,471,000 bushels, slightly less than the 1957 crop of 26,500,000 bushels which was the largest since 1930. The 1947-56 average was 14,062,000 bushels. Irrigated corn averaged 63 bushels in 1958 and non-irrigated corn 20 bushels. The average for all corn was 51.5 bushels. Both irrigated and non-irrigated yields averaged lower than in 1957 but a larger proportion of the total area was on irrigated land. A favorable fall for maturing and harvesting corn resulted in 66 per cent of the total acreage being harvested for grain in comparison with 56 per cent in 1957. The crop of "corn for grain" at 17,000,000 bushels was 18 per cent larger than in 1957, more than double the 10-year average and the largest since 1933. Quality was very good.

fruit was ripe which resulted in some loss of quality; however, most of the crop was saved. Marketing Agreement size restrictions were in effect. **Commercial apple** production estimated at 1,120,000 bushels compared with 1,505,000 bushels in 1956 and the average of 1,266,000 bushels. Apple harvest was also interrupted and unduly delayed by rain. Harvest was very late in western areas. **Pear** production at 165,000 bushels was below the 1956 crop of 225,000 and the average of 181,000. **Sour cherry** production at 1,550 tons was also less than in 1956 and average by 350 tons and 720 tons respectively. The **sweet cherry** crop totaled 420 tons against 550 tons in 1956 and the average of 598 tons.

COMMERCIAL VEGETABLES

(1957 Season)

The characteristics and contributing factors pertaining to the 1957 season were reviewed on pages five to seven of the 1956-57 edition of the Colorado Agricultural Statistics published in April 1958. Further discussion of the 1957 commercial vegetable industry in this section would amount to unnecessary repetition. However, statistics relating to acreage, production and value of individual crops grown that year are shown as comparable data in the Review of the 1958 Season found elsewhere in this text.

REVIEW OF THE 1958 CROP

(Preliminary Estimates)

The quantity of crops harvested in Colorado in 1958 was the largest ever taken from fields in the state, even exceeding the record 1957 volume. Growing and harvesting conditions were favorable and quality was also good. Winter grains did exceptionally well and the record winter wheat crop contributed largely to the over-all record. Corn and sorghums also did exceptionally well although a sharp reduction in sorghum acreage pulled 1958 production well below the 1957 record high. Even so, the 1958 sorghum crop was second highest. Potato production reached a new record volume. Sugar beet and hay tonnage was well above average. Spring small grains, dry bean and broomcorn crops fell below average.

The record total 1958 crop output was obtained from 6,325,400 acres, 5 per cent more than in 1957. Outstanding in this year's crop history was the winter wheat crop of 69.2 million bushels, 12.5 million above the previous record. Grain sorghum production of 12.5 million bushels was second only to the large 1957 crop. Corn, winter wheat, rye and grain sorghums established new record-high yields per harvested acre and barley, sugar beet, and all hay yields per acre were near their record highs. The year 1958 was favorable for fruit production—only fair for seeds.

The 1958 season started with ideal conditions for seeding winter wheat, barley and rye in the fall of 1957. Cool, wet weather through March and April assured good winter grain crops but delayed spring seeding of wheat, oats and barley. Rains in eastern Colorado in late June and much of July slowed winter grain harvest and planting of sorghums, and broomcorn. Considerable replanting of these row crops was necessary in the southeast. Hail during July was widespread with considerable crop loss in some localities. Fall weather was warm and dry. This allowed late crops to mature and permitted completion of harvest under generally favorable conditions.

Indications are that cash **receipts from sale of farm products** totaled about $566 million in 1958. This compares with the $477 million in 1957, $426 million in 1956, and the record high of $602 million in 1952.

WHEAT—Production of **winter wheat** amounted to 69,232,000 bushels in comparison with 35,378,000 bushels in 1957 and 37,514,000 bushels for the 1947-56 average. The 1958 crop exceeded the previous record of 56,700,000 bushels set in 1952 by 22 per cent. All of the principal eastern Colorado wheat counties shared in the large production. Seedings of winter wheat in the fall of 1957 totaled 3,071,000 acres. This was an increase of 53 per cent from the 2,007,000 acres sown in the fall of 1956 when over 1,300,000 acres were "soil banked." Average fall acreages seeded, 1946 to 1955, was 3,331,000 acres. Total acreage allotment for the 1958 crop was 2,705,000 acres. Winter kill, hail and plow-up for compliance at harvest after fall overseeding amounted to 12 per cent of the acreage sown or 356,000 acres and 2,715,000 acres came to harvest. Straw growth was heavy,

irrigated yield was a record high at 650 pounds primarily due to the exceptional yields secured from the acreage harvested in Southwestern Colorado. Yields there, however, were much reduced from the maximum potential due to continued rain and snow from October 10 to the end of the year. This caused much loss from shattering and discoloration.

CORN—Production of **all** corn at 26,500,000 bushels in 1957 compared with 17,340,000 bushels in 1956 and 13,531,000 bushels average. This was the largest corn crop since 1930 and the third largest of record. Record yields were obtained with irrigated corn averaging 65.0 bu. (The Iowa average in 1957 was 62.0) and non-irrigated 23.0 bu. A late October frost date in the main grain corn areas allowed late planted acreages to mature. Some corn mainly in Boulder, Larimer and Weld counties was frosted in late September but was salvaged for silage with no appreciable loss. **Grain** corn production at 14,356,000 bushels compared with 8,568,000 bushels in 1956 and 7,971,000 bushels the average. **Silage** production totaled 2,619,000 tons and was by far the largest quantity ever harvested in Colorado. The 1957 crop was 46 per cent above the 1956 crop of 1,796,000 tons and almost 3 times average.

OATS AND BARLEY—Production of **oats** amounted to 6,336,000 bushels, 81 per cent above 1956, 21 per cent above the 10-year average and was the largest crop since 1949. The yield per acre in 1957 at 36.0 bushels was the largest since 1912. **Barley** production increased sharply with 18,208,000 bushels harvested, more than double the 1956 crop of 7,975,000 bushels and more than 50 percent above average. Irrigated barley averaged 43.5 bushels per acre and non-irrigated 24.0 bushels.

SORGHUMS—A bumper crop of sorghums was produced in the state. The crop started late as rains delayed planting and necessitated considerable replanting, but growing weather through most of October allowed nearly all the acreage to mature. **Grain** harvest estimated at 16,400,000 bushels was over six times the 1956 production and more than five times the 10-year average. Both yield per acre and acreage harvested for grain were at record highs. Of the total 1,439,000 acres of sorghums harvested, 820,000 were for grain, 544,000 were for forage (including pasture) and 75,000 were for silage. **Forage** production amounted to 762,000 tons and **silage** production was 562,000 tons.

BROOMCORN—Broomcorn production at 11,200 tons was the largest since 1949, an increase of 160 percent or 6,900 tons over the small 1956 output and 35 percent over the 10-year average. Acreage harvested at 80,000 acres compared with 62,000 in 1956 and 74,000 average. While much of the acreage was planted late, practically all made brush prior to killing frost in late October. Harvest progressed slowly as a result of frequent rains and shortage of labor, however, practically all the acreage was cut by November 1.

SEED CROPS—Alfalfa seed estimated at 2,030,000 pounds compared with 2,850,000 pounds in 1956 and the average of 2,890,000 pounds. **Sweetclover** seed at 1,400,000 pounds was below the 1956 production and sharply below the 10-year average of 2,075,000 pounds. **Sudangrass** seed production rose sharply to an all-time high of 43,460,000 pounds in comparison with the 1956 crop of 9,200,000 pounds. Both average yield per acre and acres of sudangrass seed harvested were a record.

HAY CROPS—Production of **all** hay in 1957 was 2,886,000 tons, 25 percent above the 1956 tonnage of 2,303,000 and 27 percent over the average of 2,255,000 tons. **Alfalfa** hay production accounted for most of the increase, totaling 1,994,000 tons in 1957 against 1,686,000 tons for 1956 and the average of 1,501,000 tons. Production of alfalfa hay in 1957 was the largest since 1921 when 2,007,000 tons were harvested. **Wild** hay production in 1957 was 322,000 tons, 41 percent greater than the 229,000 tons cut in 1956 but still 14 percent under the average of 375,000 tons. Abundant early spring moisture and the plentiful supply of irrigation water throughout the summer promoted rank growth of all hays. All yields were at generally high levels; however, rains damaged much of the hay during harvest.

FRUIT CROPS

The 1957 **peach** crop was relatively large at 1,850,000 bushels, well above both 1956 when 1,697,000 bushels were harvested and the 10-year average of 1,736,000 bushels. Harvest was delayed by rain just as the

REVIEW OF THE 1957 CROP SEASON

Abundant crop production and very difficult harvest conditions characterized the 1957 season in Colorado. Crop production was by far the largest volume ever produced in the state. The production of feed grains, hay, roughage, and range feeds was particularly large. It was also an excellent year for range livestock. In contrast to the abundant production, adverse weather interfered with most harvest operations beginning with winter wheat and hay harvest and extending through sugar beet sorghum, and corn harvest. While harvest was difficult, actual loss in production as a result of adverse harvest weather was confined mainly to dry beans in western areas. With the exception of this loss of dry bean acreage and abandonment of 28 per cent of the seeded winter wheat acreage, the abandonment of crops was unusually light. Quality of hay was damaged considerably and some other crops also suffered quality damage from excessive moisture at harvest time, but to a lesser degree. The record output of crops was obtained from 6,021,400 acres in 1957 (excluding fruits, truck crops, and seeds), an increase of 29 per cent over the previous year. Yields per harvested acre of most crops were well above 1956 and average and record highs were obtained for several crops including corn for grain, silage corn, spring wheat, barley, rye, sorghum grains, dry beans, sugar beets and grain hay, with winter wheat, oats and alfalfa hay yields close to the all-time record highs. The 1957 season was promising from the start with an unusually wet April and May. There was an abundance of irrigation water and snowpack at high elevations was heavier than usual.

Receipts from sale of all farm products totaled about $477 million in 1957. This compares with $426 million in 1956, $404 million in 1955 and the record high of $602 million in 1952.

WHEAT—Production of **winter wheat** amounted to 35,378,000 bushels in comparison with a 1956 crop of 16,896,000 bushels and the 10-year average (1946-55) of 39,404,000 bushels. The yield per harvested acre at 24.5 bushels was more than twice that of 1956 and was 8.1 bushels above average. The bulk of the production was again in the northeast quarter of the state as plantings in east central and southeast areas lacked sufficient moisture at planting time to become established and much acreage was "soil banked." Frequent rains in July delayed harvest, which resulted in some loss of production from lodging and light test weights. The **spring wheat** crop amounted to 1,144,000 bushels. This was well above the small 1956 crop of 756,000 bushels but was only 61 per cent of the 10-year average production. The larger production in 1957 resulted from the high yield per acre, as the area harvested was small.

POTATOES—The 1957 **fall** potato crop (mostly for market after October 1) totaled 8,482,000 cwt. compared with 1956 production of 7,547,000 cwt. and the 1949-55 average of 8,157,000 cwt. The 43,500 acres harvested was above the 42,400 in 1956 and the 7-year average of 43,800. Yield per harvested acre at 195 sacks was above the 1956 average of 178 sacks and the 7-year average of 186 sacks per acre. Irrigation water supplies were adequate to plentiful in contrast with shortages the previous year. There was some delay in harvesting although much of the acreage had been harvested prior to the October rains. The government program was again in effect for diverting potatoes to livestock feed and starch. The **late summer** potato crop estimated at 2,375,000 sacks was well below the 1956 production of 2,650,000 sacks with a reduction in yield from 250 to 190 sacks more than offsetting an acreage increase.

SUGAR BEETS—The largest crop of sugar beets in the state since 1947 was harvested in 1957 with the average yield per acre at a record high of 17.7 tons per acre. The total tonnage at 2,399,000 tons was well above the 1956 crop of 1,893,000 tons and the 10-year average of 1,898,000 tons. General rains which started about October 10 and extended through most of November slowed harvest operations and made them very difficult. Many beet tops were pressed into the mud during harvest and much feeding value was lost.

DRY BEANS—Dry bean production was estimated at 2,063,000 bags (100 pounds clean basis), 47 per cent above the short 1956 crop of 1,408,000 bags and 9 per cent above average. Irrigated beans averaged 1,570 pounds per acre although restricted somewhat by blight, white mold and rust in Northern Colorado. Harvest weather was favorable in that area. The non-

WHY CROP AND LIVESTOCK REPORTS

A man's judgment is no better than his facts and crop reports are the basic facts of Agriculture.

They aid farmers in planning their production and marketing.

They are essential in enacting wise legislation affecting Agriculture.

They are the basis for analysis of agricultural and other business conditions.

They enable railroads to make a better distribution of cars for moving farm products.

They give producers the same foresight to future price trends that organized dealers possess.

They are a check on fluctuation in price. Uncertainty of supply promotes undue fluctuation in price.

They are indispensable in times of war because food is as essential as ammunition and weapons of war.

They are the best basis for adjusting supply to demand which is highly essential if maximum price is to prevail.

They aid farm organizations, schools and others in planning constructive programs, and the prospective purchaser of land.

They give information on surplus and deficit areas of production making possible a more economical distribution of products.

They eliminate the ill effects of misleading reports that might be circulated for private gain, if there were no official reports.

They are a guide to farm resources and for developing new resources such as irrigation, electric power, location of food processing and other factories.

They reduce the amount of speculation in farm products. Speculation thrives on uncertainty. Unbiased official crop reports reduce uncertainty which limits speculation.

They indicate potential buying power thereby enabling the manufacturer to meet the probable demand. With economical production and distribution, the manufacturer can sell at a lower price than he could with uncertain demand.

They reduce the risk of ownership of buyers of farm products which enables them to do business on a smaller margin. Under the stimulus of competition, they pay producers higher prices than could be paid if uncertainty of production existed.

They provide an accurate, unbiased picture of Colorado's agriculture. The facts on present and prospective supplies furnish a sound basis for judgment and action by farmers, other individuals, business men, railroads, crop and livestock interests and governmental agencies.
