FLORIDA AGRICULTURAL OVERVIEW

Florida's 43,000 **commercial farms**, utilizing 10.1 million **acres**, continue to produce a wide variety of safe and dependable food products. From the **citrus** in central and southern Florida, to the **vegetables** in pockets around the State, to the **cattle and calves** for beef and dairy products throughout the State, these farms provide Florida with a large and stable economic base.

In 2003 Florida's cash receipts ranked:

- 9th in the nation with **total cash receipts** from farm marketings of over \$6.4 billion
- 1st in **citrus, snap beans, fresh market tomatoes, cucumbers, squash, and sugarcane**
- 2nd in sales of **greenhouse and nursery products, sweet corn, peppers and strawberries**
- 3rd in **watermelon**
- 4th in **honey** sales

In 2003, Florida accounted for:

- 70 percent of the total U.S. cash receipts for **oranges** (\$990 million)
- 66 percent of the **grapefruit** (\$167 million)
- 60 percent of the **tangerines** (\$57 million)
- 56 percent of the **cane for sugar** (\$560 million)
- 34 percent of the **peppers** (\$174 million)
- 28 percent of the **tomatoes** (\$516 million)
- 23 percent of the **cucumbers** (\$86 million)

The total cash receipts for **nursery and greenhouse** products in Florida were just over \$1.6 billion in 2003. **Livestock and livestock products** produced sales of over \$1.2 billion, with \$330 million coming from sales of **dairy products** and \$348 million coming from sales of **beef**. **Poultry farms** generated \$326 million in sales, with \$179 million coming from **broilers** and \$145 million coming from **eggs**.

Florida **aquaculture** products contributed \$95.5 million in sales. Tropical fish accounted for sales of \$47.2 million; aquatic plants accounted for \$20.4 million; and clams accounted for \$13 million.

Florida growers harvested **vegetables for fresh market** from 185,800 acres in 2004, with sales exceeding \$1.2 billion. Florida citrus growers in 2003-2004 produced 242 million boxes of **oranges** (96 percent of which were used for **orange juice**) and 40.1 million boxes of **grapefruit** (59 percent of which were used for **grapefruit juice**).

On January 2005 there were 1.74 million **head of cattle** on farms and ranches in Florida, including 952,000 head of **beef cows** and 138,000 head of **milk cows**.

Florida ranked 9th in the number of **chickens** on farms in 2004 Florida's poultry farmers maintained an average of 11.3 million **layers** in 2004 (producing 3.1 billion **eggs**) and produced 78.5 million **broilers**.

FLORIDA CASH RECEIPTS – 2003

Farm cash receipts from marketing Florida agricultural products in 2003 amounted to \$6.45 billion, a decrease of 3.2 percent from the previous year. Nationally, Florida ranks 2nd in the value of **vegetable and melon** production with cash receipts of \$1.4 billion, 4th in **all crops** with receipts of \$5.2 billion, and 9th in **total** cash receipts

FLORIDA AGRICULTURE CASH RECEIPTS, 2003

FARMS AND LAND IN FARMS

Florida had 43,000 commercial farms in 2003, using a total of 10,100,000 acres. There were 6,300 farms with sales exceeding \$100,000. The average farm size was just under 235 acres. The number of farms in Florida has remained fairly stable over the past 10 years. Florida ranks 22nd among all States in number of farms and 29th in land in farms.

2003-04 SEASON CITRUS HIGHLIGHTS

PRODUCTION

U.S. citrus production for the 2003-04 season was 8 percent above the 2002-03 season, but 8 percent lower than the record high production for the 1997-98 season. Florida accounted for 79 percent of the total U.S. citrus production; California totaled 18 percent, while Texas and Arizona produced the remaining 3 percent.

Florida's total production of 291.8 million boxes was an increase of 16 percent above the 2002-03 season and was higher for all varieties except the white grapefruit and tangelos. It was the highest production since the 1990-00 season total of 298.4 million boxes, and the fourth highest on record. The orange crop, at 242.0 million boxes was 19 percent greater than the previous season. Valencia orange production surpassed the previous season by 27 percent and early-midseason-Navel production was up 13 percent.

CITRUS BOX WEIGHTS

Approximate net weight by fruit type and states

State	Orange	Grapefruit	Tangerine	Lemon	Lime
<i>Pounds</i>					
FL	^{1/} 90	85	95	90	88
CA	75	67	75	76	--
TX	85	80	--	--	--
AZ	75	67	75	76	--

^{1/} Includes Temples and tangelos at 90 pounds.

Florida's citrus acreage totals 748,555 acres as of January 2004, a net decrease of 48,748 acres (6.1 percent) in the past two years. Acreage decreased for all orange categories except other early and other midseason oranges which include the newer varieties. Nearly 40 percent of the grapefruit acreage has been lost since the record set in 1994. The 2004 total is 16 percent lower than in 2002. Specialty citrus types decreased 15 percent since 2002. Temple acreage continues to decline and is down 25 percent. Acreage declined for the fourth time for Fallglo and Sunburst early tangerine varieties. Honey tangerine acreage is down less than 1.0 percent. Tangelo acreage decreased 13 percent. Lemon acreage increased 1.6 percent. The small quantities of Robinson and Dancy tangerines, limes, and K-Early Citrus are now included in other citrus.

LEADING CITRUS STATES: 2003-04 SEASON

COUNTY PRODUCTION

Estimates of citrus production by counties were prepared using objective survey data obtained from the citrus crop estimates program. Production for Florida has been distributed to counties based on the biennial citrus tree census, limb count survey data adjusted for droppage to end of season, and size data at maturity.

Tree numbers by county which are used in the estimates were obtained from the latest tree census. Productivity per tree is obtained from several objective fruit surveys including limb count, size, and droppage. Because of the statistical sampling design, counties with higher production in general have a greater number of samples and, therefore, estimates for these counties can be considered more reliable. Thus, for the same reason, estimates for the production areas are more reliable than for the individual counties.

VALUE

The **U.S.** citrus crop value for 2003-04 was up 4 percent from last season. Total value of production for 2003-04 was higher for all types of citrus, except lemons, tangelos, and Temples.

Florida's \$746.0 million preliminary value of the 2003-04 citrus crop is down 5.3 percent from the 2002-03 season's revised value of \$787.4 million.

Prices and values were lower for all orange varieties. Early-midseason-Navel value was down 24 percent, Valencia orange value was down 8 percent. Grapefruit price per box increased 27 percent and total value increased 34 percent.

Price per box and value for tangerines were lower for the early category (Fallglo and Sunburst) but higher for the Honey variety resulting in a lower price, but higher value for all tangerines. Temple on-tree price fell to the lowest since 1966-67 and equals only 53 percent of last season's value. The preliminary price for tangelos is higher than any revised price in the series and the crop value is up 20 percent from last season. Prices for the 2003-04 season are preliminary and will be revised next September when the results of all participation plans and pools become final.

FLORIDA CITRUS:

Value of sales on-tree, crop years 1994-95 through 2003-04

Crop year	Value	Crop year	Value
	<i>1,000 dollars</i>		<i>1,000 dollars</i>
1994-95	948,173	1999-00	1,108,523
1995-96	1,075,817	2000-01	862,031

^{1/} Revised.

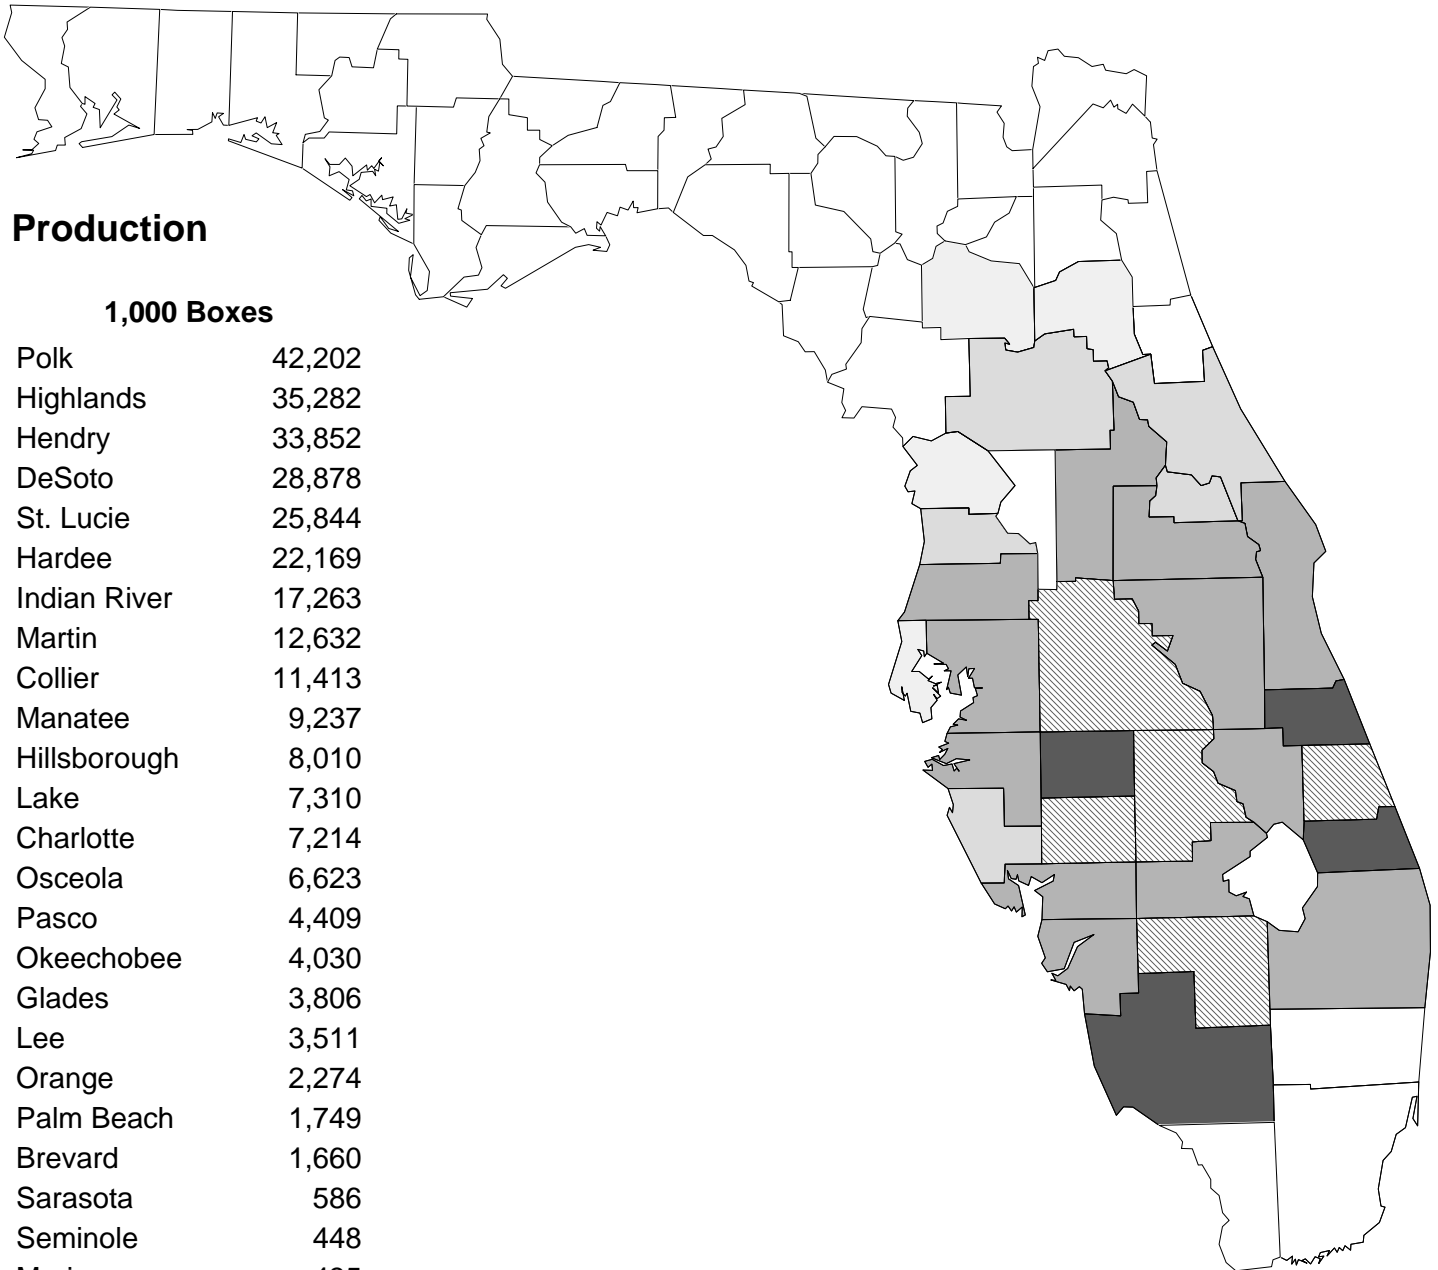

^{2/} Excludes lemons.

^{3/} Preliminary.

FOREIGN EXPORTS

Fresh fruit exports totaled 23.4 million 4/5-bushel cartons. Canada accounts for the majority of Florida orange and specialty fruit exports while Japan receives the most grapefruit. A total of 19.7 million gallons of FCOJ was exported, mostly to Canada, and Florida exported 11.0 million gallons of FCGJ. FCOJ exports were almost twice as much as last year, and FCGJ exports were slightly more than one-and-a half times as much as last year.

FLORIDA CITRUS HARVESTING SEASON

AVOCADOS

Production of avocados decreases from the previous season by 560,000 bushels, or 45 percent. This production of 680,000 bushels is the smallest crop since the 176,000 bushels produced in the 1993-94 season. Bearing acreage is estimated at 6,100 acres, up from last season. The total value of the crop was down at \$13,736,000, even though prices paid to growers for fruit delivered to the packinghouse door were up from the previous season. More than two dozen minor tropical fruits are grown in South Florida. These varieties, sold mostly on the local fresh market, include annona, banana, carambola (star fruit), Barbados cherry, coconut, guava, jaboticaba, jacfruit, key lime, kumquat, litchi, longan, mango, monstera, papaya, passion fruit, plantain, pummelo, sapodilla, black sapote, mamey sapote, white sapote, and wax jambu.

2004 FIELD CROPS HIGHLIGHTS

VALUE

The 2004 value of production for hay, peanuts, cotton and cottonseed, tobacco, corn, pecans, soybeans, and wheat in Florida at \$179,836,000 decreased by nearly 8 percent or \$16 million from the 2003 value of \$195,633,000. The value of peanuts, hay, soybeans, and wheat rose while the value of production for cotton and cottonseed, tobacco, and corn declined.

ACREAGE AND PRODUCTION

Acreage harvested for the field crops estimated, totaled 545,000 acres for crop year 2004, up 3 percent or 15,600 acres from the 529,400 acres harvested during the 2003 crop year. Peanuts, hay, soybeans, and wheat showed increases from the previous year to acres harvested, while cotton, tobacco, and corn showed a decrease. Hay, peanuts, soybeans, and wheat production increased from the previous year while corn, cotton, pecans, and tobacco production declined.

SUGARCANE

The value for the 2003 crop of sugarcane was set at \$525,297,000, down two percent from the 2002 value of \$536,649,000. Sugarcane cash receipts made up seventy-eight percent of Florida's cash receipts from field crops and nearly nine percent of all cash receipts from the marketings of Florida agricultural products. Florida ranks number one in the production of sugarcane nationwide. Sugarcane was the third leading commodity of 2003 cash receipts in the State, exceeded by only cash receipts from greenhouse and nursery sales and orange sales. The production of sugarcane, along with citrus, boosts Florida to the number four spot for cash receipts from crops nationwide with only California, Iowa and Illinois having higher cash receipts from crop marketings.

CROP WEATHER

Dry, cool conditions persisted during most of **January** 2004. At the beginning of the month, temperatures plunged to near freezing levels due to an Arctic cold air mass covering the State. Moderate frost on the ground was reported on several mornings in northern locations and to a lesser degree in central locations, especially near the end of the month. Sugarcane harvesting in the Everglades remained steady during the month. Tobacco plant beds progressed normally in northern areas. Row crop producers were preparing land for planting at the end of the month. Mostly cool temperatures during **February** limited plant growth in nearly all localities while disease affected some small grain forage. Significant rains fell over most Panhandle and northern Peninsula localities with abundant rains near the end of the month slowing land preparations for peanut planting. The ground was too dry to dig fence post holes in Union County early in the month. Sugarcane harvesting remained mostly on schedule during the month with some activity slowed by abundant rainfall near the end of the month. Dry conditions during the first half of **March** gave way to spotty showers during the last two weeks. Most temperatures for the month averaged above normal with northern areas recording some temperatures near freezing during the first part and again at the end of the month. Northern Peninsula and Panhandle producers resumed field preparations and planting of peanuts and corn at the beginning of the month as soils dried from the late February downpour. Flooding in low spots of the Panhandle and cold temperatures held back small grain forage growth in early March. Tobacco transplanting was in full swing during the first half of the month with Union County growers finishing by mid-month. Dry soils prevented some planting in the Panhandle and northern Peninsula in mid-March. Santa Rosa County producers prepared land for peanuts and cotton during the last two weeks. The Sunshine State did not receive many **April** showers. Cotton planting was delayed due to dry soil and cool temperatures. However, significant rains in some Panhandle and northern Peninsula areas permitted producers to begin

planting corn as well as preparing land for peanuts at a rapid pace. The lack of precipitation by mid-April caused a number of producers to delay some cotton and peanut planting until adequate soil moisture was available. Scattered showers after mid-month boosted tobacco growth. Corn planting slowed but remained active mid-month despite some gusty winds that dried out the soils. By the end of the month, only a few acres of peanuts had been planted to avoid tomato wilt virus and some cotton had been “dusted in.”

By the beginning of **May**, many producers received the rainfall that they needed to replenish the soil moisture for their crops but dry weather soon returned. About 15 percent of peanut planting was finished by early May compared to only 8 percent the prior year. In Madison and Taylor counties, many tobacco growers finished transplanting by early May. Wet weather started replenishing the soil moisture levels by mid-month which boosted the growth of corn and allowed cotton and peanut planting to proceed at an active pace; however, more rain was needed to help the crops get an effective start. Peanut planting progress jumped to 40 percent completion. Haymaking remained active throughout the month in many localities. Soil moisture levels declined dramatically during the last half of the month leading many producers to wait on rain before finishing peanut planting. Other growers delayed double crop planting until small grain harvests were complete. Despite the dry, hot conditions, by month's end, most crops maintained good condition. Scattered storms helped alleviate dry conditions in many localities during early **June** which boosted crop growth and development, yet, prevented some haymaking. The increase in precipitation raised soil moisture in some areas while continued drought lowered supplies in other regions, posing a threat for wild fires. Cotton was in good condition by early June with only a few farmers replanting due to poor germination. Most producers finished peanut planting, except for the green peanut crop, by mid-month with a quarter of the crop pegged. The oldest cotton acreage started forming squares by mid-month with plants in Santa Rosa County showing good retention of squares after mid-month. Tobacco in Jefferson County had some foliar disease due to earlier rainfall while producers in Taylor County began to pull leaves for curing near the end of the month. Frequent rains during the last half of June hampered hay cutting, curing and baling, as well as timely applications of pesticides to cotton and peanuts in several Panhandle and northern Peninsula localities. Some fields were too wet for equipment movement. Pecan trees in Jefferson County showed an extremely light nut set at the end of the month. Producers prepared to dig green peanuts in late June with activity beginning in early **July**. Corn was in good condition as July arrived. Frequent but scattered rains during July kept soil moisture supplies adequate to surplus in most areas but still allowed farmers to pull tobacco and cut hay. Temperatures were about normal for the month with daytime highs in the low 90s and nighttime lows in the high 60s and low 70s. Early in the month, rains prevented timely applications of pesticides in some peanut fields with tomato wilt virus infesting some acreage; however, most peanuts remained in good to excellent condition throughout the month. Insects and armyworms remained a problem in some Panhandle and northern Peninsula peanut, cotton and hay fields during the month. Tobacco pulling remained active throughout the month. The percent of peanuts pegged reached 93 percent by July 26, compared with 89 percent the previous year and the 5-year average of 86 percent. Cotton condition was good at the end of the month with most acreage escaping rain spun off from Tropical Storm Alex and another tropical system developing in the Gulf of Mexico off the southwestern coast.

Tropical Storm Bonnie and Hurricane Charley both hit the State during the week of **August 9** through 15. Bonnie formed in the Gulf of Mexico and brought major precipitation to the Panhandle on August 11. The wind and heavy rain from Tropical Storm Bonnie delayed peanut digging in Jefferson County but perked up hay fields not yet cut. Hurricane Charley plowed a destructive swath across the Peninsula from Port Charlotte to Daytona Beach with hurricane force winds and heavy rains causing very extensive property damage. Heavy rainfall was reported by stations all across the Panhandle and the Central Peninsula with over six inches reported in Apopka, Avalon, Daytona Beach, Madison, Jefferson, and Santa Rosa. The rains alleviated moisture stress in some Panhandle cotton and peanut fields. Most peanut acreage escaped storm damage with only a few fields plowed up. Drier weather over the Panhandle the week after the storms allowed field work to advance with peanut digging starting in Jackson County. Tobacco contract collection centers opened in early August. By mid-month, cotton bolls started to open in the oldest northern Peninsula and Panhandle fields. Tobacco pulling finished in Taylor County about mid-month. Producers applied con-

trols for armyworms and other pests in some peanut, cotton and soybean fields in the Panhandle. At the end of the month, dryland peanuts needed rain to mature properly in some eastern Panhandle and northern Peninsula fields as digging gained momentum in southern parts of the production area. The effects of tomato spotted wilt virus on peanuts lowered yields in oldest fields. Worm infestations continued to plague some Panhandle and northern Peninsula cotton acreage. Corn for grain yield reached near record levels in some northern Peninsula and Panhandle localities.

Tropical systems continued to damage field crops throughout **September**. Hurricane Frances made landfall over the southern end of Hutchinson Island on September 5 as a category 2 hurricane and gradually weakened as it moved slowly west-northwestward across the Florida Peninsula. Frances became a tropical storm just before emerging into the northeastern Gulf of Mexico near New Port Richey early on September 6 and did not strengthen when it made a final landfall near the mouth of the Aucilla River in the Big Bend region on September 6. The northwestward motion continued until September 7 when Frances re-curved northeastward into the westerlies over eastern Alabama and western Georgia. Rain from the storm boosted growth and development of soybeans, peanuts and cotton which need moisture prior to the storm's passing. However, wet fields delayed some peanut digging. Since the storm skipped the far western Panhandle, cotton and other field crops in that area were not harmed. Strong winds caused uprooted trees and limb breakage on pecan trees in Jefferson County with a lot of the crop damaged. Around mid-September, Hurricane Ivan spun off tornadoes in the Panhandle in addition to dumping torrential rainfall. Some outer bands of rain from Ivan fell in scattered areas of the Peninsula. Intense winds tossed crops and heavy rains flooded fields in areas affected by the storm. The continuous precipitation caused very soggy soils, previously saturated with water from Hurricane Frances, which hampered producers from putting heavy equipment in the fields. Hence, peanut digging and other field activities slowed in the Panhandle. The storm delayed hay making and corn harvesting. Jefferson County again lost a devastating amount of the remaining pecan crop to limb breakage and uprooted trees due to this additional catastrophic weather event. Hurricane Ivan emerged over the southern Gulf of Mexico after passing Cuba on September 14 and turned north-northwestward and then northward just off the Gulf coast. The outer rain bands from Hurricane Ivan fell over the southern Peninsula. A steady but slow weakening trend ensued and the storm made landfall as a category 3 storm on September 16, just west of Gulf Shores, Alabama. By this time, the eye diameter had increased to 40-50 nautical miles wide which resulted in some of the strongest winds occurring over a narrow area near the southern Alabama-western Florida Panhandle border. The storm spun off tornadoes in the Panhandle in addition to dumping torrential rainfall. Some outer bands of rain from Ivan fell in scattered areas of the Peninsula. Intense winds tossed crops and heavy rains flooded fields in areas affected by the storm. The continuous precipitation caused very soggy soils, previously saturated with water from Hurricane Frances, which hampered producers from putting heavy equipment in the fields. Hence, peanut digging and other field activities slowed in the Panhandle. The storm delayed hay making and corn harvesting. Some corn acreage was lost in Washington County. Jefferson County again lost a devastating amount of the remaining pecan crop to limb breakage and uprooted trees due to this additional catastrophic weather event. Drier weather in the Panhandle following the storm aided in the recovery of cotton from Hurricane Ivan damages with most losses occurring in oldest fields. Muddy conditions slowed cotton defoliation. Producers were able to dig peanuts during the drier weather with harvest nearly a third done by late September. Some soybeans shattered with some acreage lost in the Panhandle and northern Peninsula. Hurricane Jeanne entered the east coast of Florida on September 26 making landfall on the east coast with the center of its 50 nautical miles diameter eye crossing the coast at the southern end of Hutchinson Island just east of Stuart. Maximum winds at landfall were estimated at 105 knots over a very small area north of the center but it is not clear whether these strongest winds reached the coast or remained over water. Jeanne moved west northwest across the central Peninsula while weakening. The hurricane weakened to a tropical storm while centered about 30 nautical miles north of Tampa on September 26. The storm interrupted hay mowing and baling in affected areas. Drier conditions during **October** over most of the Peninsula and Panhandle localities allowed field work to progress rapidly during October with only minimal scattered showers in some areas. Soils were able to dry out during the month in some Panhandle localities while a few areas re-

ported short to very short soil moisture levels. However, many low lying areas remained too wet from the earlier rains to support any heavy equipment. Younger cotton acreage showed less damage from the tropical storms as picking got started before mid-month. Some cotton acreage was difficult to harvest due to the lodging of stalks while most cotton in Jefferson County was lying down and matted from the previous heavy rains. Peanuts were rated 90 percent in good condition by early October with growers speeding up the digging during the month. Peanut digging finished and cotton picking was underway in Santa Rosa County by mid-month. Hay quality diminished while producers continued to bale as fields dried out. Scattered rains in late October delayed some cotton and peanut harvesting in Washington County. Cool mornings and hot afternoons made hay baling difficult in some northern Peninsula localities. Sugarcane harvesting started in the Everglades region by the end of the month as peanut digging neared the end. Cool morning temperatures during early **November** slowed some hay baling in the central Peninsula. Peanut digging, except for the green peanut crop, was completed by mid-November in most Panhandle and northern Peninsula localities. Cotton picking was three-fourths completed in Santa Rosa County by mid-month while harvesting fell behind normal in Calhoun County due to earlier storms. Some northern producers made the last cuts of hay for the year by late month. Many small grain growers needed rain to finish planting due to mostly dry weather during the month depleting soil moisture supplies. Sugarcane harvesting remained active in the Everglades region throughout the month. Cold fronts sweeping the State during late month brought rainy weather to many localities and caused temperatures to dip to near freezing in several northern Peninsula and Panhandle areas. Mostly mild, dry weather allowed field work to proceed at a steady pace during **December**. The nearly ideal weather allowed small grain growth to make excellent progress. Mild temperatures delayed the dormancy of some nursery stock in the Panhandle with plants still holding leaves by mid-month. Temperatures over the central and southern Peninsula remained warm during most of the month. Cold fronts, crossing the State around mid-month, and again during the last half, caused hard freezes and frosts, especially in low lying areas, with some Panhandle and northern Peninsula temperatures plunging into the 20s. Dry conditions in most areas depleted soil moisture until a cold front crossing over the Peninsula late in the month brought much needed rain to many localities. Producers finished picking most cotton by mid-to-late month.

2004 LIVESTOCK HIGHLIGHTS

DAIRY

Florida dairies produced 2.25 billion pounds of milk in 2004. This was up from 2.16 billion pounds produced during 2003. In 2004, the milkfat content was 3.62 percent. Annual production per cow was 16,326 pounds, up from 15,218 pounds in 2003.

An average 138,000 milk cows were on Florida farms and commercial dairies in 2004, 4,000 head less than in 2003. Florida ranked 16th among States in number of milk cows, unchanged from 2003.

Cash receipts from marketings of Florida milk in 2004 totaled \$432 million, up from \$329 million in 2003. The price of replacement milk cows peaked at \$1,900 per head in July 2004, and a record high. The annual average farm-gate price for milk in Florida was \$19.20 per cwt in 2004, up from \$15.30 in 2003. The price peaked in June at \$25.20 per cwt, and the lowest average monthly price was \$15.80 per cwt in February.

Ice cream and sherbet production in Florida was 48,121,000 gallons in 2004, up from the 2003 production level of 43,989,000 gallons.

BEEF

All cattle and calves on Florida farms and ranches as of January 1, 2005, including dairy cattle, totaled 1,740,000 head, unchanged from 2004. Beef cows in Florida were 952,000 head, up 2,000 head from 2004. Nationally Florida ranked 12th in beef cows and 17th in total cattle.

The average annual beef price of cattle marketed in Florida in 2004 was \$63.20, up from \$50.50 per cwt in 2003. The average price for calves was \$121.00 per cwt, and a record high up from \$97.60 per cwt in 2003.

Calves born during 2004 totaled 910,000 down 10,000 head from 2003. Calves marketed from Florida in 2004 totaled 661,000 head. Almost 73 percent of the calf crop of Florida was marketed.

POULTRY

The total value of Florida chicken and egg production in 2004 was \$369 million, up from \$324 million in 2003. Egg production was valued at \$160 million, up from \$145 million in 2004. The average annual price for eggs (hatching and table eggs combined) was 62.5 cents per dozen, up from 62.1 cents per dozen in 2003.

The value of broilers produced in Florida during 2004 totaled \$208 million, up from \$179 million of a year earlier. The average annual price of broilers in 2004 was 45.0 cents per pound, an increase from 35.0 cents per pound in 2003.

The value of sales from Other Chickens was \$700,000. This includes sales of spent hens and roosters. Hens and pullets of laying age on farms on December 1, 2004, were 10.8 million birds. This compares to 11.0 million in 2003.

Florida liveweight broiler production in 2004 totaled 463 million pounds, down from 511 million pounds in 2003. Broilers raised in Florida during 2004 totaled 78.5 million birds, down from 98.3 million birds in 2003.

Florida egg production, in the production year of December 1, 2003 to November 30, 2004, was 3,068 million eggs. This was an increase from the previous year's production of 2,804 million eggs.

Commercial hatcheries produced 66.4 million chicks in 2004, down from 70.4 million in 2003. Broiler-type chicks accounted for 58.4 million chicks, and egg-type chicks were 8.0 million.

HOGS

The average market year price in 2004 was \$43.70 per cwt, up from \$30.00 per cwt in 2003. The price of hogs peaked in July at \$52.40 per cwt, and the lowest monthly price was \$30.40 per cwt in December 2003. There were 99,000 head slaughtered in 2004, down from 108,200 head in 2003.

HONEY

Honey production in 2004 was 20,090,000 pounds, up from 14,910,000 pounds in 2003. Florida ranked 3rd in honey production behind North Dakota and South Dakota. There were 205,000 colonies in Florida in 2004 with an average honey yield of 98 pounds per colony, 27 pounds per colony more than in 2003. Producers received an average of \$1.00 per pound for the honey, down 32 cents per pound from 2003. The value of Florida honey production in 2004 was \$20.1 million, up from the 2003 value of \$19.7 million.

2003-04 SEASON VEGETABLES HIGHLIGHTS

VALUE

The 2003-04 value of production sold for vegetables, berries and watermelons estimated totaled \$1,649,851,000, up two percent from the 2002-03 value of \$1,623,892,000. Cabbage, sweet corn, Bell peppers, watermelons, strawberries and blueberries showed increases in the value of production from the previous season's value. The 2003-04 production values for snap beans, cucumbers, tomatoes, squash and potatoes dropped from the 2002-03 values.

ACREAGE

Harvested acreage of vegetables, berries and melons, including miscellaneous vegetables, totaled 284,200 acres during the 2003-04 season, down less than one percent from the 284,600 acres harvested during the 2002-03 season. Declines occurred in acreage harvested for sweet corn, cucumbers, tomatoes and potatoes. Acreage increased for snap beans, Bell peppers, squash, watermelons, and blueberries. Cabbage and strawberry acreage showed no change from the previous season.

Acreage double cropped was counted twice for the estimates, but acreage abandoned before maturity due to natural causes and acreage reaching maturity but not harvested due to economic reasons was excluded. Economic abandonment was limited to economic factors such as low prices, shortages of labor, transportation, containers and packing facilities, marketing order decisions affecting size, grade or cullage, and interruptions of the normal market flow. Economic abandonment did not include the usual trimming and grading losses which occur during harvesting and packing.

PRODUCTION

Snap bean, sweet corn, cabbage, Bell pepper, squash, tomato, watermelon, strawberry and blueberry production for 2003-04 all showed increases while the production of cucumbers and potatoes dropped. The 2003-04 yields per acre increased for snap beans, cabbage, sweet corn, Bell peppers, tomatoes, watermelon, potatoes, strawberries and blueberries, but dropped for cucumbers. The 2003-04 yield per acre for squash did not change from the 2002-03 average.

WEATHER

The clash of the Atlantic and Gulf of Mexico sea breezes, coupled with moisture from tropical systems, caused daily, scattered storms during **July 2003** with some land preparation for the planting of fall crops delayed. Flooding damaged some Baker County vegetables. Water accumulation in low lying areas hindered the growth and development of early plantings in some southern Peninsula fields. However, drought conditions stressed some cover crops in St. John's County potato fields. Cloud cover kept most July temperatures below normal. Miami-Dade County growers continued to cut okra throughout the month. Wet conditions continued into early **August** which interrupted field activities. Wet, muddy fields slowed some planting and prevented the application of pesticides to some acreage. The leaching of fertilizer along with the prevention of fertilizer applications slowed development of some acreage. By the end of August, producers in the Hastings area were plowing under cover crops and planting cabbage and broccoli. The August rains reduced yield prospects for tomatoes around Quincy by increasing bloom and fruit drop. Southern Peninsula growers started planting snap beans in early **September**. The harvesting of cucumbers and peppers got underway in mid-to-late month with very light amounts marketed. Okra harvesting in Miami-Dade County continued during most of the month. Drier weather during the first part of the month

allowed the planting of fall crops to proceed at a normal pace in the southern Peninsula. Rains returned during the last part of the month which interrupted some planting, although most was on schedule. Sweet corn picking started during late September in the Everglades region. Dry weather returned during **October** with the harvesting of very light amounts of cucumbers, eggplant, okra, peppers, squash and watermelons active during most of the month. Tomato picking started around Quincy by early October as northern Peninsula snap bean harvesting got underway. Frequent rains in the Homestead area during the month reduced the effectiveness of pesticides, thus increasing insect populations. By late month, strawberry growers, mainly in the Plant City-Dover area, had planted about half of intended acreage, and tomato producers in the Palmetto-Ruskin area picked a very light supply of tomatoes. By the end of the month, Miami-Dade County growers staked the oldest tomato fields.

By early **November**, Miami-Dade County snap beans began to set fruit while picking in central and other southern areas slowly increased as more acreage reached maturity. Growers harvested to meet the Thanksgiving Day demand during most of the month. Dry conditions continued during most of the month, prompting producers to irrigate in drier areas of the central and southern Peninsula. Strawberry growers finished most transplanting by early November and started picking a light amount of berries by Thanksgiving Day. Tomato picking nearly finished around Quincy by the holiday but gained momentum in the Palmetto-Ruskin, Immokalee and East Coast growing areas throughout the month. Potato field preparations continued around Hastings with planting active by the end of the month. Harvesting of leafy crops got underway during late November in the Everglades and in some central Peninsula localities. Temperatures remained warm during the first half of November but dipped to freezing levels in many northern and central Peninsula and Panhandle localities in late November and continued through most of **December**. The cooler temperatures aided strawberry development around Plant City but brought most Panhandle and northern Peninsula harvesting to an end by early December. Dry conditions continued during most of the month with growers providing supplemental water as needed. Cabbage cutting and broccoli harvesting remained active in the Hastings area during the month. By mid-month, northern growers started land preparations for the planting of spring crop watermelons. Heavy rains in some central and southern Peninsula localities near mid-month slowed planting and lowered the quality of the more tender crops. In late December, light frosts and freezes occurred in some central and southern Peninsula localities. The cooler temperatures brought fall crop okra harvesting to an end in Miami-Dade County as snap bean picking got underway. Celery cutting became active in the Everglades area in late December.

Dry, cool conditions persisted during most of **January**. At the beginning of the month, strawberry producers around Plant City kept nighttime surveillance as temperatures plunged to near freezing levels due to an Arctic cold air mass covering the State. Moderate frost on the ground was reported on several mornings in northern locations and to a lesser degree in central locations, especially near the end of the month. Tomato picking was virtually finished in the Palmetto-Ruskin region by mid-month as Miami-Dade County producers increased harvesting. Tomato picking in the Immokalee and East Coast areas was steady throughout most of the month. Potato producers started planting in the Hastings area about mid-month. However, a lack of contracts for chipping potatoes limited the planting of processing types until contracts were secured. Significant rains fell in most areas during the last week of January with some vegetable planting and harvesting curtailed for a few days. Mostly cool temperatures prevailed during **February**. Significant rains fell over most Panhandle and northern Peninsula localities during the month with abundant rains near the end of the month slowing land preparations for watermelon planting. Southern Peninsula producers dug potatoes for most of the month with rain delaying some potato planting and cabbage cutting around Hastings early in the month. Vegetable harvesting was active with snap beans, celery, sweet corn, cucumbers, eggplant, endive, escarole, lettuce, peppers, radishes, squash and tomatoes available. Significant rains during the last week of February curtailed some planting and harvesting over the southern Peninsula. Dry conditions during the first half of **March** gave way to spotty showers during the last two weeks which

allowed growers to get planting and harvesting back on schedule as soils dried from the late February downpour. Most temperatures for the month averaged above normal with northern areas recording some temperatures near freezing during the first part and again at the end of the month. Most potato planting was finished around Hastings by early March. Cabbage cutting around Hastings and in other areas, and potato digging in southern areas increased as growers met the mid-March holiday demand with snap beans, celery, sweet corn, eggplant, escarole, endive, lettuce, peppers, squash, strawberries and tomatoes available throughout the month. Tomato planting was active around Quincy and blueberries reached full bloom in Jackson County by mid month. Dry soils prevented some planting in the Panhandle and the northern Peninsula around mid month. Cabbage cutting halted around Hastings until abundant rains, received just after mid month, drained from soils. Oldest potato fields around Hastings started to bloom and oldest sweet corn plantings began to emerge around Lake Okeechobee after mid month. Jefferson County growers started transplanting watermelons by the end of the month. Strawberry picking in the Plant City area and the harvesting of leafy greens, such as endive, escarole and lettuce around Lake Okeechobee slowed at the end of March as warmer temperatures arrived. Oldest potato plantings in the Hastings regions reached full flower by early **April**. Planting started to slow seasonally in southern Peninsula areas at the beginning of April. The Sunshine State did not receive many April showers which allowed harvesting to keep on schedule. During the first half of the month, strong winds in Madison County tossed some irrigated vegetable plants about. Central and northern Peninsula producers picked blueberries with very light supplies available. Harvesting of very light amounts of okra was underway in Miami-Dade County, and a few southern Peninsula producers harvested very small quantities of watermelons. Significant rains in early April provided needed soil moisture to some acreage in Washington and Jackson counties which allowed the resumption of watermelon transplanting. Strawberry picking continued to slow during the first half of the month with growers opening many fields to the U-Pic market. About mid month, cool temperatures slowed the growth of some Marion County crops while gusty winds continued to damage some Madison County fields. Watermelons in Gilchrist County were forming runners by mid month. Hastings producers dug the first few loads of potatoes near mid month as a sluggish market hindered onion movement. During the last half of the month, the digging of chipper potatoes got underway around Hastings as the harvest of table types continued in central and southern Peninsula areas. Cabbage cutting slowed after mid month while Panhandle producers started to harvest some squash. Cool night temperatures hindered the growth and development of some crops at the end of April.

Strong winds accompanying storms tossed crops as **May** arrived with some yield prospects lowered due to bloom loss and fruit scarred by wind-borne sand. Producers in some parts of the Hastings region and central Peninsula delayed potato digging until fields dried. During early May, harvesting increased to satisfy the Memorial Day demand with snap beans, blueberries, cabbage, cantaloupes, celery, sweet corn, cucumbers, eggplant, endive, escarole, okra, peppers, potatoes, radishes, squash, tomatoes and watermelons marketed throughout the month. At the end of May, hot temperatures brought most harvesting to an end in the central and southern Peninsula with most blueberry, snap bean and squash harvesting finished. Some truck shortages hindered the movement of potatoes from central Peninsula areas, including the Hastings region. Picking of tomatoes in the Quincy area started by early **June** with showers during the first week slowing activity. Tomato harvesting in central areas declined by mid month with picking virtually completed in the Immokalee and East Coast areas by the last week. Taylor County watermelon picking started about mid-month. Growers harvested okra, watermelons, cantaloupes, sweet corn, cucumber, eggplant, peppers and potatoes throughout the month to satisfy the Independence Day demand. Some tomato picking around Quincy slowed due to low prices during late June. Hot temperatures and rains during late June and early July brought most harvesting to an end with the Quincy tomato crop suffering significant damage from the rains.

DEFINITIONS AND EXPLANATIONS

PLANTED ACREAGE is the total acreage which has been planted for harvest during the crop year. Acreage lost and replanted to the same crop in time for harvest in the same quarter is counted only once. Acreage harvested and planted again to the same crop is counted twice.

HARVESTED ACREAGE is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

YIELD is the average production per harvested acre of merchantable quality harvested and sold or utilized for human consumption.

PRODUCTION is the quantity actually harvested and sold or utilized for human consumption.

UNIT VALUE for fresh market sales is the equivalent price received, f.o.b. shipping point basis and encompasses all grades and sizes marketed or utilized. Included are packing charges, selling charges, precooling, top ice, or other costs which contribute to the value of the product at shipping point. The value per unit for quantities sold to processors is the

average value paid for usable quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

TOTAL VALUE is the equivalent value of production sold or utilized based on the unit value. Cullage and other quantities not sold or utilized because of natural or economic factors are excluded.

OTHER COUNTIES include harvested acreage for all counties for which either published data would result in the disclosure of individual operations or acreage totals for specific commodities of minor importance in the State.

PRODUCTION AND PRICE UNIT--The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to what is believed to be the most commonly used containers. If changes in container weights are necessary, all data pertaining to the production of the commodity in question are revised to maintain comparability between years. The table below gives the net weight used per container and the number of containers per hundredweight for Florida produce.

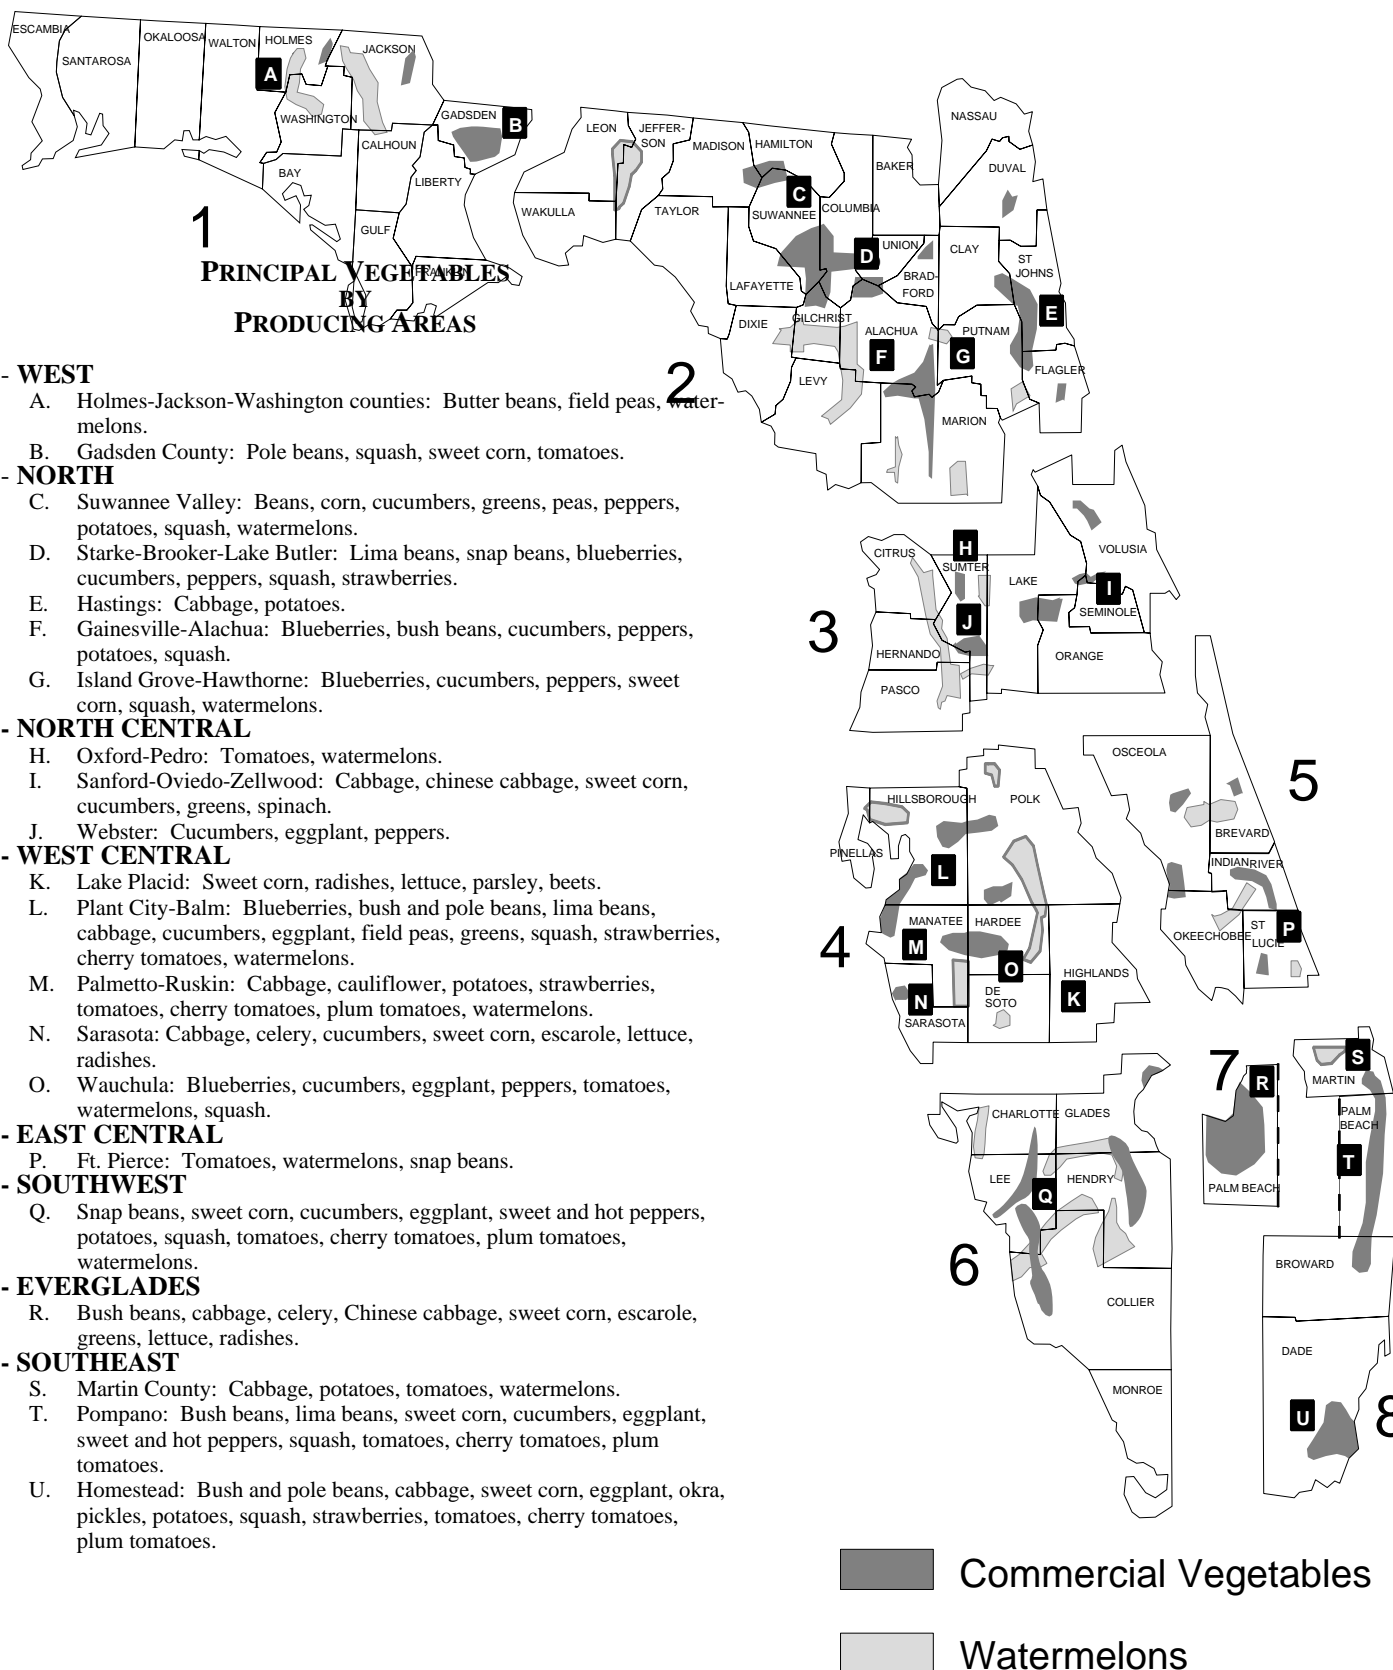

FLORIDA PRODUCE

2004	205	98	20,090	1.000	20,090	2,009

^{1/} Producers with five or more colonies.

AQUACULTURE HIGHLIGHTS

Tropical fish, aquatic plants, and clams are the three major categories of aquaculture production in Florida. Sales of tropical fish in most years exceed \$40 million, and in 1997 reached \$57 million. Sales of aquatic plants have exceeded \$20 million in the past two survey years. Clam sales dropped to \$12 million in 2003.

Sales of alligator hides and meat have dropped to \$2.5 million in 2003. Florida producers of catfish and tilapia sold almost \$3 million of fish in 2003.

The remaining aquaculture products include shrimp, oysters, food fish, sport and game fish (bass, bluegill, etc.), and live rock.

FLORIDA AQUACULTURE

Number of producers, area in production, value of production

Year	Number of producers	Area in production		Value of production
		<i>Surface acres</i>	<i>Square feet</i>	<i>1,000 dollars</i>

AGRICULTURAL STATISTICS & OTHER INFORMATION

INTERNET

NASS national & State reports and data are available on the world wide web, the Internet.

NATIONAL HOMEPAGE

www.usda.gov/nass/

The national homepage has links to all agency products and services such as publications, graphics, historic data, State information, statistical research, Census of Agriculture, a search engine and a Published Estimates Data Base to query and download State or county historic data. There are also links to our Customer Service unit, a Kids Page, and all other federal statistics outside the National Agricultural Statistics Service.

For a monthly summary of USDA estimates, forecasts and projections of commodities, prices, trade issues, and world crop developments, see:

www.usda.gov/nass/pubs/nassfact.htm

FLORIDA HOMEPAGE

www.nass.usda.gov/fl/

The Florida web site offers much of the same information as the national homepage but in a format designed for Florida customers. The reports contain the same statistics but offer more details about agriculture in Florida. Links are also available to other sites such as the Florida Department of Agriculture, University of Florida and other NASS field offices.

PRINTER REPORTS & COMPUTER FORMAT

All NASS reports are still printed on paper. Census reports are only available while supplies last; contact the Florida office for a copy. NASS also offers a wide variety of data on diskettes or CD-ROM with national, State, and county statistics. Most of these products are in Lotus 1-2-3 spreadsheet format or comma separated (CSV) files.

A listing of all paper reports and computer products can be found in the Products & Services catalog issued every December. To order a free Products & Services catalog or purchase paper reports, diskettes or CD-ROMs, call the order disk at:

1-800-999-6779

E-MAIL SUBSCRIPTIONS

Free e-mail subscriptions are available via automated mailing lists for National and State reports. You can subscribe to individual reports and they will be sent directly to your e-mail address soon after the official release time.

NATIONAL REPORTS VIA E-MAIL

National reports contain statistics from all states and are the most timely source of data. For more information, see:

www.usda.gov/nass/pubs/pubs.htm

or send e-mail to:

usda-reports@usda.mannlib.cornell.edu

and in the body of the message type the word: **list**

STATE REPORTS VIA E-MAIL

State reports are distributed after national reports but they usually contain more local information. To learn more about this service, see:

www.usda.gov/nass/ssr-rpts.htm

or send e-mail to:

listserv@newsbox.usda.gov

and in the message text (not the subject), type two lines with one word on each line: **lists**
help

To subscribe to the Florida Weather & Crop News the message text (not the subject) would be:

**subscribe usda-fl-crop-
weather [your name]**

AUTO-FAX

Selected NASS reports and information items are available from a free fax service called NASS-Fax. To receive the items, use a touch tone telephone connected to your FAX machine to call:

202-720-2000

Voice prompts will guide you to selected items of interest. The first time you access the system, request **Document number 0411** which will provide a listing of the information that is available in reports.
