## **Acknowledgment**

The acreage, production, utilization, monthly and season price, and crop value statistics for Florida as shown in this summary and corresponding data for other citrus states are official estimates of the USDA's National Agricultural Statistics Service. Appropriate references appear when data are from other sources. Chilled and frozen pack statistics were compiled by the Florida Department of Citrus. Records of the Division of Fruit and Vegetables were used in preparing production and utilization estimates. The Citrus Administrative Committee assisted in assembling these data. Many producers, shippers, processors, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The inventory data contained in this report were developed at the request of and with funds provided by Florida's citrus industry. Its leaders sought accurate information for projecting future production and recognized the requirement to maintain current citrus tree and acreage inventories. The work was directed by the Florida Agricultural Statistics Service which supervised photo interpretation, field checking, and assembly of the data. Field survey work is a continuing cooperative project of the Florida Agricultural Statistics Service and the Division of Plant Industry. Private and public officials contributed to this work by supplying information and other assistance.

## FLORIDA COMMERCIAL CITRUS PRODUCTION AREAS

## Statistical Methodology

**Survey Procedures:** Grower, packer, and objective measurement surveys are used to collect acreage, production, yield, price, and value data. Grower and packer surveys are conducted by mail, telephone, and personal interview. Objective measurement data is collected in citrus groves.

**Estimating Procedures:** Information obtained from the citrus grower, packer, and objective measurement surveys along with administrative data is used to establish estimates of bearing acres, production, yield, price, and value. These estimates are reviewed for errors, reasonableness, and consistency with historical estimates.

**Revision Policy:** Current season estimates are open for revision in April and August.

**Reliability:** The citrus grower and packer surveys are subject to non-sampling errors such as omission, duplication, and mistakes in reporting, recording, and processing the data. These errors cannot be measured directly, but are minimized through rigid quality controls in the data collection process and careful review of all reported data for consistency and reasonableness.

## Terms and Definitions

**Acid:** The citric acid present in citrus fruit. Also, a percent measurement of the amount of acid present in juice.

**Bearing Trees:** Trees are considered bearing for production three years after being planted.

**Brix:** A measure of the concentration of soluble solids in juice, mostly sugar content as well as salts, protein, and acid content. It is a quality factor that helps determine when the fruit is ready for harvest.

**Carton:** A  $\frac{4}{5}$  bushel box or  $\frac{1}{2}$  field box.

**Citrus crop year:** Begins with the bloom of the first year listed and ends with the year harvest is completed.

**Delivered-In Price:** The price paid by processors for fruit, including harvesting and transportation to the plant.

**Equivalent on-tree (EOT) price:** Represents the PHD price minus picking and hauling costs.

**Field Box:** 1- $\frac{3}{5}$  bushel equivalent. See page 11 for a table of citrus box weights by fruit type and state. One box equals 2 cartons.

**Freight on board (FOB) price:** A commercial price term that signifies a contractual agreement between a buyer and a seller to have the subject of a sale delivered to a designated place, usually either the "place of shipment" or the "place of destination," without expense to the buyer. This term indicates delivery will be made on board or into a carrier by the shipper without charge. The abbreviation FOB is usually followed by a shipping point or destination. Reports from fresh fruit sales organizations and from citrus packers provide data for an average FOB price.

**Frozen Concentrated Grapefruit Juice (FCGJ):** Grapefruit juice that has had all excess water removed and the resultant product frozen, making it more suitable for storage or transportation while also extending its shelf life. The term especially refers to product at 40.0 degrees Brix.

**Frozen Concentrated Orange Juice (FCOJ):** Orange juice that has had all excess water removed and the resultant product frozen, making it more suitable for storage or transportation while also extending its shelf life. The term especially refers to product at 42.0 degrees Brix.

**Frozen Concentrated Tangerine Juice (FCTJ):** Tangerine juice that has had all excess water removed and the resultant product frozen, making it more suitable for storage or transportation while also extending its shelf life. The term especially refers to product at 42.0 degrees Brix.

**Packinghouse door (PHD) price:** The packinghouse door is generally referred to as the point of first sale. PHD prices are calculated by subtracting costs incurred through the packinghouse from the FOB price. These costs may include sorting, grading, packing, cooling, etc.

**Pound Solids (PS):** The amount of soluble solids (sugars and acid) contained in one box of citrus fruit.

**Ratio:** The Brix to acid content relationship; i.e. Brix divided by percent acid.

**Yield:** Count, volume, or weight of a product per some specified unit. Commonly used to indicate the amount of FCOJ available per box of oranges or as a measure in terms of pounds of solids per box. Also used to express the volume of fruit per tree or per acre or volume of juice per box of citrus fruit.

## Florida Citrus Pricing

All prices reported in this publication, except the prices in the table on page 11, are on-tree prices representing the average price received by growers for their fruit. The term "on-tree" relates to fruit returns to the grower after the costs of picking, hauling, and packing has been removed. Prices are based on records of commercial fresh fruit sales and processed fruit returns.

Each season, beginning with the first month that a fruit type is harvested, monthly estimates are computed. Reports from fresh fruit sales organizations and from packers provide data for an average freight-on board (FOB) price. Processors report an average spot and cash price for fruit delivered to their plants. From these values, an estimated charge for picking, hauling, and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sale.

At the season's end, monthly price averages are computed and weighted by boxes utilized to provide the preliminary season average price. A year later, after most processed products are sold, cooperatives and firms with participation plans report prices of fruit they handled. These prices, combined with the spot and cash prices collected earlier, are weighted together by varieties to determine the final processing price received by growers. From this price, charges for picking, hauling, and packing, as estimated by University of Florida economists, are deducted to arrive at the final on-tree price received by growers. The preliminary figures for the season are revised and released annually in late September.

## Packout Rates

Fresh prices shown in this publication are for "pure fresh" or 100% packout. Grading diverts a portion of the crop from fresh use. Returns at processing plants for this diverted fruit will generally be less than for field run fruit because of extra costs. In order to compare fresh prices shown in this publication to the individual grower's return, it is necessary to calculate a derived price for that crop. Below is an example and a blank table for calculating fresh returns based on packout rates.

The example describes a delivery of 1,000 boxes with a packout rate of 60% (0.60 in decimal format). At this rate, 600 boxes (1,000 x 0.60) are shipped fresh at a price of \$9.50 per 1-<sup>3</sup>/<sub>5</sub> bushel box equivalent. The remaining 400 boxes (1,000 x 0.40) are eliminations hauled to a processing facility and receive a price of \$1.20. The grower receives \$5,700.00 for the fresh portion and \$480.00 for the processed portion. Dividing the total amount of \$6,180.00 by the total of 1,000 boxes results in a derived price of \$6.18 per box.

### Sample Calculation of Grower's Return (1,000 Boxes)

	Packout Rate		Prorated Boxes	On-tree Price	Amount Received	Derived Price
	Percent	Decimal				
Shipped Fresh	60	0.60	600 x Fresh	\$9.50 =	\$5,700.00	
Eliminations	40	0.40	400 x Processed	\$1.20 =	\$480.00	
Delivered to Packinghouse	100	1.00	1,000		\$6,180.00	<b>\$6.18</b>

### Calculate Your Return

	Packout Rate		Prorated Boxes	On-tree Price	Amount Received	Derived Price
	Percent	Decimal				
Shipped Fresh			x Fresh	=		
Eliminations			x Processed	=		
Delivered to Packinghouse						

## FLORIDA CITRUS HARVESTING SEASON

### 2014-2015 Season Highlights

#### Production

U.S. citrus utilized production for the 2014-2015 season totaled 9.02 million tons, down 4 percent from the 2013-2014 season. Florida accounted for 56 percent of total United States citrus production, while California totaled 41 percent, and Texas and Arizona combined produced the remaining 3 percent.

Florida's share of U.S. citrus production was 112.65 million boxes in the 2014-2015 season, down 9 percent from the previous season's 124.13 million boxes. Production decreased for all citrus varieties when compared to last season.

Florida's all orange production decreased by 8 percent to 96.8 million boxes. All grapefruit production is down 18 percent to 12.9 million boxes. Production of Honey tangerines is down 28 percent and early tangerine production is down 17 percent, resulting in a 22 percent decrease in all tangerines. Tangelo production is down 23 percent.

#### Area and County Production

The top 5 citrus producing counties were Polk (16.8 million boxes), Hendry (15.8 million boxes), De Soto (13.7 million boxes), Highlands (12.7 million boxes), and Hardee (10.1 million boxes). Together they account for 61 percent of the State's total citrus production. The Southern area had the most citrus, followed by the Central and Western areas. The remaining two areas, the Indian River and Northern area, account for only 17 percent of the State's total citrus production. Oranges constitute 86 percent of the citrus production, grapefruit accounted for over 11 percent, and tangerines and tangelos represent almost 3 percent.

Estimates of county production are prepared from objective survey data used in forecasting citrus crop production. The apportionment of final harvest to the counties is based on bearing trees, an estimate of the average fruit per tree, and the drop and size surveys. Sample size used in these surveys and the distribution of the sample groves around the State are chosen to minimize error in the estimates of production and are not to be considered as accurate for the counties as at the State or area levels.

## Value

The value of the 2014-2015 United States citrus crop decreased 9 percent from last season, to \$3.38 billion (packinghouse-door equivalent). Total value of production for 2014-2015 is lower for all citrus crops except lemons. Orange value of production decreased 13 percent from last season and grapefruit value is down 17 percent. Tangerine and mandarin value of production is 8 percent lower than last season and lemon value of production is up 8 percent. Tangelo value decreased 3 percent from the previous season.

Florida's \$1.03 billion preliminary on-tree value of the 2014-2015 citrus crop is 12 percent less than the revised value of \$1.17 billion for 2013-2014. The price per box is higher for tangelos and tangerines, but lower for oranges and grapefruit.

## Foreign Exports

Fresh fruit exports totaled 7.0 million <sup>4</sup>/<sub>5</sub> bushel cartons. Japan accounted for the majority of Florida grapefruit exports. Canada received most of Florida's orange and specialty fresh fruit exports. More details are listed on page 45. A total of 9.0 million gallons of Frozen Concentrated Orange Juice (FCOJ), and 2.4 million gallons of Frozen Concentrated Grapefruit Juice (FCGJ) were exported in the 2014-2015 season.

## Citrus Value of Sales On-Tree – Florida: Crop Years 2005-2006 through 2014-2015

Crop year	Value <sup>1</sup> (1,000 dollars)	Crop year	Value <sup>1</sup> (1,000 dollars)
2005-2006 .....	1,024,610	2010-2011 .....	1,368,626
2006-2007 .....	1,499,112	2011-2012 .....	1,640,423
2007-2008 .....	1,283,994	2012-2013 .....	1,164,763
2008-2009 .....	1,046,735	2013-2014 <sup>2</sup> .....	1,173,181
2009-2010 .....	1,131,107	2014-2015 <sup>3</sup> .....	1,034,114

<sup>1</sup> Does not include lemons.

<sup>2</sup> Revised.

<sup>3</sup> Preliminary.

## Frozen Concentrate

Final Frozen Concentrated Orange Juice (FCOJ) yield, as reported by the Florida Department of Citrus, was 1.502203 gallons per box of 42° Brix concentrate. A record FCOJ yield of 1.673141 was set in the 2007-2008 season. The early-midseason portion of the crop finalized at 1.419546 gallons per box. The late crop yielded 1.584149 gallons per box.

The final Frozen Concentrated Grapefruit Juice (FCGJ) yield was 1.174619 gallons per box of 40° Brix concentrate, down from last season's final of 1.213862 gallons per box. A record FCGJ yield of 1.364660 gallons was set in the 2006-2007 season.

The final Frozen Concentrated Tangerine Juice (FCTJ) yield of 1.372700 gallons per box of 42° Brix concentrate was slightly lower than last season's final of 1.383379 gallons per box. A record FCTJ yield of 1.757423 gallons was set in the 1992-1993 season.

## Priced Average Delivered-in Processed Citrus Fruit – Florida: Crop Year 2014-2015

Variety	Price per box	Price per pound of solids
	(dollars)	(dollars)
All oranges .....	10.671839	1.744306
Early-midseason .....	9.503146	1.631702
Valencia .....	11.811859	1.844372
All grapefruit .....	5.206181	1.176437
White .....	5.881457	1.344332
Red .....	4.374624	0.974866

## Citrus Box Approximate net weight by fruit type – States: Crop Year 2014-2015

State	Orange	Grapefruit	Tangerine	Lemon	Lime
	(pounds)	(pounds)	(pounds)	(pounds)	(pounds)
FL .....	<sup>1</sup> 90	85	95	90	88
CA .....	<sup>2</sup> 80	<sup>3</sup> 80	<sup>2</sup> 80	<sup>4</sup> 80	(X)
TX .....	85	80	(X)	(X)	(X)
AZ .....	(X)	<sup>5</sup> (X)	<sup>2</sup> 80	<sup>4</sup> 80	(X)

X Not applicable.

<sup>1</sup> Includes Temples and tangelos at 90 pounds.

<sup>2</sup> Was 75 pounds prior to the 2010-2011 season.

<sup>3</sup> Was 67 pounds from 1993-1994 to 2009-2010.

<sup>4</sup> Was 76 pounds prior to the 2010-2011 season.

<sup>5</sup> Was 67 pounds from 1993-1994 to 2008-2009.

## **Weather, by Month – Florida: Crop Year 2014-2015**

The first week of March 2014 brought average rain to most areas, with warm temperatures in the low to mid 80s. Citrus bloom was first seen early in the month and a full citrus bloom was observed in all areas on both oranges and grapefruit by the third week. April rain was much lighter, but widespread, with temperatures in the mid 80s throughout the citrus region. The bloom was just about over. By the end of the first week, small pea size fruit was seen in most areas. Growers reported a good fruit set for the next season's crop.

Light precipitation was reported the first week of May and daytime temperatures reached the low 90s in all citrus producing counties. The lower portion of the citrus region was dry and abnormally dry conditions had returned to the southernmost portion of Collier county by month's end. In June, typical weather patterns were forming for the summer with moderate to heavy afternoon showers. Rainfall was widespread and heavy during the months of July and August, with seasonal temperatures averaging in the low to mid-90s across all of the citrus production areas. September had heavy rainfall amounts; however, drought conditions continued in some parts of the citrus growing region.

In October, temperatures were slightly higher than average most days, frequently reaching the mid to upper 90s. Rainfall totals were less than historical averages across the citrus growing region; most areas had two inches of rainfall or less for the month. Even with less rainfall, soil moisture improved and abnormally dry or drought conditions receded from all citrus producing areas.

November temperatures were seasonable warm, frequently reaching the mid 80s during the day. The first two weeks of the month were very dry, but rainfall during the second and third week brought totals to above historical monthly averages. December rainfall amounts were less than average for this time of the year. Most northern citrus growing counties recorded about two inches of rainfall or less, and East Coast counties received about an inch of rainfall. Most central and southern counties had only between one-half and one inch of rainfall for the month. The beginning of the month was very cool, but daily highs had warmed to the mid 80s by the end of the month.

January 2015 rainfall amounts were slightly less than average. Most citrus growing counties recorded two inches of rainfall or less during the month; some East Coast counties and northern counties had slightly more rainfall. Temperatures were typical for this time of the year. Daily highs were mostly in the 70s, while minimum temperatures were usually in the 40s. February temperatures were about average the beginning of the month. A cold snap during the third week of the month brought temperatures below freezing in practically the complete citrus growing region. Temperatures below 30 degrees were sustained for less than two hours in nearly all places, causing minimal negative effect to citrus trees and fruit. For the first time in several months, drought conditions returned to the citrus area. By the end of the month, abnormally dry conditions were present in Collier county, parts of Hendry county, and in the lower half of the Indian River District.

March precipitation was very light until the final week of the month when much needed rainfall fell in all citrus producing counties. Totals were between one and one-half inches to two inches in several counties. In April, precipitation was above normal in the citrus producing region. Totals were more than two inches in all counties, and between four and six inches in several central and southern citrus production area counties. Daily high temperatures were seasonably warm during May, reaching the mid 80s early in the month, and into the lower to mid 90s by the end of the month. Precipitation was sporadic in the citrus producing region. Totals were far less in the Indian River and northern areas, amounting to less than an inch in five of eight monitored weather stations. The southern citrus area received ample rainfall where five of nine weather stations received over three inches, with the highest total of over five inches in Collier county.

Daily high temperatures were mostly warmer than normal during June, reaching the mid to high 90s on several days in all citrus growing areas during the month. Precipitation was less than average in about one-half of the monitored citrus growing counties, mostly in the western and southern citrus growing areas.

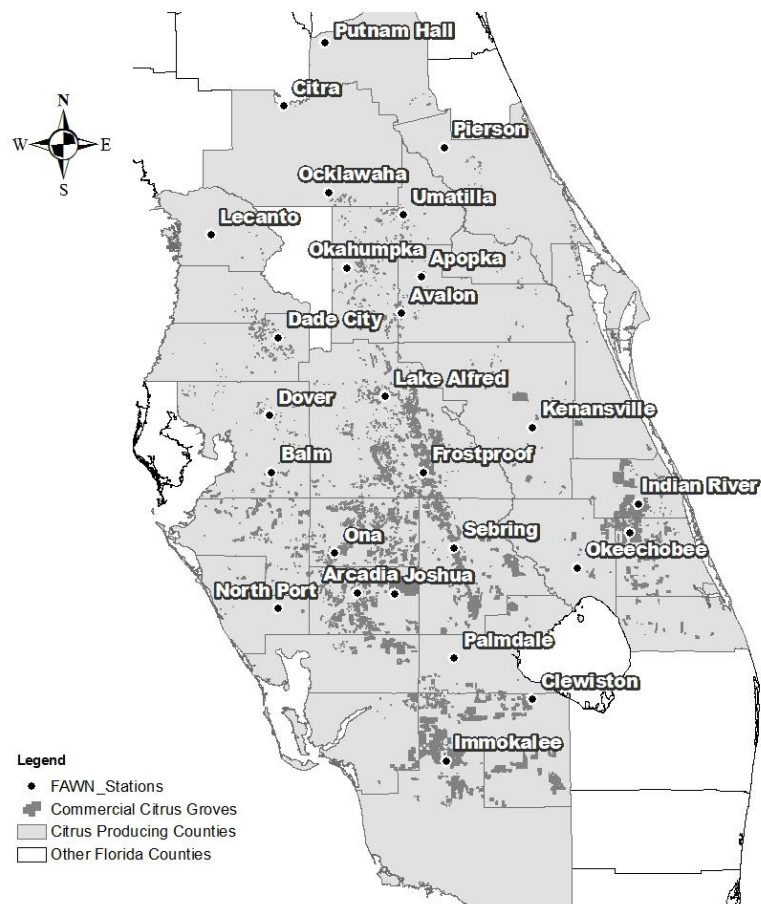

Daily high temperatures were slightly warmer than normal during July, reaching the mid to high 90s on several days in all citrus growing areas during the month. Precipitation was average or above in about two-thirds of the monitored citrus growing counties. Even though rainfall totals were overall higher than normal, abnormally dry conditions still remained in the eastern coastal counties of Volusia, Indian River, St. Lucie, and Martin. All central and western citrus producing counties were relatively drought free. Orange harvest was over for the season. Growers were now focusing on the next season's crop.

<sup>1</sup> Average weighted by bearing trees.

The Florida Agricultural Statistics Service conducts objective surveys to determine fruit per tree, average sizes, and droppage between August and maturity. These data are used to estimate production per tree for each of four types of citrus fruit, as shown in the following tables. The estimates of production per tree are based on official end-of-season production estimates and the number of bearing trees indicated by the Commercial Citrus Inventory. The averages of boxes per tree for age groups shown are calculated from estimates of fruit per tree in August, size at maturity, and drop between August and maturity. Additionally, the boxes are subdivided by production areas. Estimated boxes by types and age groups are weighted averages of the indicated seasons. Small sample sizes in some age/area cells and rounding may contribute to inconsistent averages.

<sup>1</sup> Included in freeze damage report.

Monthly maturity and yield test results for early and midseason oranges are published from September 1 through February 1, for late oranges October 1 through May 1, and for grapefruit September 1 through December 1.

Results of maturity tests are averages for the State, using only regular bloom fruit. At the beginning of each season, over three-fourths of the grapefruit sample groves are located in the Indian River District while nearly 90 percent of the orange sample groves are in the other four areas. Sample groves and trees remain relatively constant from season to season. Fruit was picked from trees throughout the five areas of the citrus growing region. Each sample was weighed, juiced, and tested in the Florida Agricultural Statistics Service (FASS) laboratory.

## Maturity and Yield Test Results: Unadjusted Averages for Regular Bloom Fruit from Sample Groves – White Seedless Grapefruit: Crop Years 2010-2011 through 2014-2015

[Averages of regular bloom fruit from sample groves. Juice and solids per box are unadjusted and not comparable to juice processing plant test results. All samples were run through an FMC 091 machine using mechanical pressure only. This machine utilizes a 0.040 short strainer and standard 5/8 inch orifice tube. The beam settings are also identical to past tests and no restrictors are used]

## Survey Procedures

This publication presents the results of the seventh annual survey of Florida citrus trees (following 22 biennial surveys) and is the ninth using digital imagery. The Florida Agricultural Statistics Service first began indexing citrus groves using aerial photography with the January 1966 survey. The 1966 inventory report included detailed data by county, variety, and year set and the survey was designed for quick and economical updating. Subsequent surveys, using aerial photography, were conducted as of January every two years through 2006. The remotely sensed data now used allows for rapid replacement and maintenance of background images. Grove boundaries are digitized and saved as geodatabases in our Geographic Information System (GIS). GIS software provides tools to enhance comparative photo interpretation for grove change detection. This technology provides current tree inventory data for evaluating Florida's potential citrus production in a shorter period of time and at less cost than by ground survey methods alone.

With the change to an annual survey came a systematic division of the workload. Florida is a public land state which uses a rectangular survey system to identify land. Lines extend out from a central point in Tallahassee. Range lines run north/south and township lines run east/west. The land described between the lines is a township composed of 36 sections, each usually 1 square mile in area. The figure below shows a township divided into quadrants. In seasons ending in odd-numbered years, those sections in the northern half of each township are visited. The sections in the southern half of the townships are visited during the even-numbered years. As time permits, additional grove inspections are performed during the current survey period. Field work is completed in mid-July of each year.

Field personnel identify varieties in blocks where trees were too young to be identified in earlier surveys, change the status of declining blocks, delineate new groves, and record new trees in existing groves. In blocks of citrus which are interset, acreage is proportionate to the number of trees of each variety or age in the block. In the multi-reset blocks, two or more resets are planted for each tree removed and the spacing must be averaged due to the variable distance between trees. The spacing between rows in one direction remains constant for grove travel.

After field inspection, photo interpreters create polygons which are linked to datasets, and saved in county geodatabases for all new citrus groves. Changes in variety blocks may result in alterations to grove boundaries or status. A software tool provides the means to measure the exact acreage of new and altered citrus groves. All statistical information (identifying features, variety, year set, tree spacing, tree numbers, and vacancies) is then keyed into a database and retained for future use. Net acres are computed from the combination of tree numbers and tree spacing as measured by field personnel.

Throughout the survey, new maps are plotted and new section tabulations are printed to prepare updated field kits since resurveying is a continual process. Quality checks for accurate variety counts will be conducted as well as the identification of the three-year-old plantings that are to be included in next year's objective count surveys.

The data in this report relate to commercial groves, those containing a minimum of 50 trees from which fruit is generally sold. In addition, the grove must have been cultivated and trees must show viable growth in the limb scaffold. Groves no longer meeting these parameters are defined as abandoned and not included. See page 62 for additional information on abandoned groves. Variety totals were rounded to the nearest acre and one hundred trees. Item totals that fell below these parameters were listed as zero. For this reason, users are cautioned that zero cells in some of the data tables could actually have a positive entry, but would be less than one half acre and below 50 trees.

The acreage shown is land which is actually planted with citrus trees. Bayheads, ponds, sinkholes, drainage canals, lateral and swale ditches, roads, turn rows, and wide middles were excluded. Where vacancies within a commercial grove were numerous, they were counted and acreage was then reduced to equivalent net acres of commercial trees. Non-bearing trees are listed by the calendar year in which set. At the county level, bearing trees are aggregated into three year groupings (except for the three oldest age groupings). At the state level, bearing tree data is reported for each year individually, with the exception of the three oldest age groupings. When available, grove managers' records were used to establish age. Young tree age was estimated from both trunk circumference and tree height.

Identification of citrus varieties is generally dependent upon the presence of fruit. Many young groves visited for the first time are indexed as unidentified until fruit is available for variety determination. Acreage and trees in this report listed as "Unidentified" will be resurveyed and classified by variety in the next inventory. The unidentified trees and acres are listed by year set and by county under all Florida citrus. The unidentified trees and acres are also included in the all orange and all grapefruit totals.

Data itemized under "Other citrus" include minor types and varieties, such as K-Early Citrus, kumquats, limes, Ortaniques, Ponkans, pummelos, Meyer lemons, certain tangerines (Dancy, Robinson, and Satsuma), unclassified citrus, and unidentified mandarins. They are not reported individually.

## Survey Highlights

Results of the annual Commercial Citrus Inventory show total citrus acreage is 501,396 acres, down 3 percent from the last survey and the lowest in a series which began in 1966. New plantings, at 12,343 acres, is the most recorded in a single season since the beginning of annual surveys in 2009. The gross loss of 26,094 acres is the largest single season loss recorded during the same period.

Of the 29 counties included in the survey, 22 recorded decreases in acreage, 6 showed increases, and 1 was unchanged. St. Lucie County had the largest net decrease for the second consecutive year, down 2,819 acres from last year, while Brevard County had the highest percentage net loss, with an almost 30 percent acreage reduction. Hendry County had the highest gain of 708 acres, followed by Charlotte, De Soto and Lake Counties. Polk County remains the leader with 80,488 acres.

Orange acreage declined to 441,628, continuing a trend that began after the 2000 survey. Grapefruit acreage is now at 43,962, the lowest in the series. Specialty acreage declined 6 percent and is now at 15,806.

Total citrus trees have declined steadily from the peak in 1998 to 66.8 million. Polk continues to lead with 9.9 million trees, followed by Hendry with 9.7 million, De Soto with 8.9 million, and Highlands with 7.7 million. The total is composed of oranges, 89 percent; grapefruit at 7 percent; and the remainder, including specialty and other citrus, at nearly 4 percent. Bearing trees decreased about 3 percent to 61.0 million while non-bearing trees increased over 13 percent to nearly 5.9 million since the previous survey.

## Commercial Citrus Trees and Acres – Florida: Survey Years 1968-2015

## Commercial Citrus Trees per Acre, by Type – Florida: Survey Years 1968-2015

## Abandoned Acreage

Untended citrus groves were identified, and their location recorded during the annual Commercial Citrus Tree Inventory. Tree condition was evaluated and an overall assessment was made of these visited citrus groves. Some groves previously identified as abandoned have either been destroyed or returned back to production. Abandoned groves are a threat to the citrus industry and are a haven for bacteria that cause disease.

Additional groves are added each year when they meet the abandoned grove criteria. A citrus grove is classified as abandoned when the following conditions exist: no care during the past 2 years, lack of weed control or grass mowing, livestock present, trees that are not economically feasible to maintain, or no commercial harvest during the last 2 seasons. Whenever possible, property owners or caretakers were contacted regarding the future use of their groves. Understory acres include pine stands and forested areas with abandoned, unintentional, or feral citrus trees scattered underneath their canopy.

Four of the five production areas show decreases in abandoned acres. Of the 30 counties surveyed, 14 show increases and 16 show decreases in total abandoned acreage. The Indian River production area has the largest percent of the state's total abandoned acreage at 44 percent. By county, St. Lucie County has the largest number of abandoned acres at 33,435 acres, followed by Martin County with 17,482 acres abandoned.

- Represents zero.

<sup>1</sup> Includes unidentified oranges, seedy and unidentified grapefruit, lemons, Meyer lemons, and Dancy and Robinson tangerines.

## Florida Commercial Citrus Marketing Districts

### Florida Statutes 601.091 Florida SunRidge, Indian River, and Gulf production areas, boundaries, and designation.

(1) Unless otherwise specifically provided by final court order entered as a result of a legal proceeding instituted prior to July 1, 1976, only citrus fruit grown within the boundaries of a specified production area of this state, or processed citrus products prepared solely from such citrus fruit, may be identified, classified, labeled, or otherwise designated with the name of such production area or identified, classified, labeled, or otherwise designated in any manner so as to imply that such citrus fruit, or processed citrus product produced therefrom, was grown in the specified production area.

(2) The “Indian River” production area of this state shall encompass only that part of the state particularly described as follows: Beginning at a point on the shore of the Atlantic Ocean where the line between Flagler and Volusia Counties intersects said shore, thence follow the line between said two counties to the southwest corner of Section 23, Township 14 South, Range 31 East; thence continue south to the southwest corner of Section 35, Township 14 South, Range 31 East; thence east to the northwest corner of Township 15 South, Range 32 East; thence south to the southwest corner of Township 17 South, Range 32 East; thence east to the northwest corner of Township 18 South, Range 33 East; thence south to the St. Johns River, thence along the main channel of the St. Johns River and through Lake Harney, Lake Poinsett, Lake Winder, Lake Washington, Sawgrass Lake, and Lake Helen Blazes to the range line between Ranges 35 East and 36 East; thence south to the south line of Brevard County; thence east to the line between Ranges 36 East and 37 East; thence south to the southwest corner of St. Lucie County; thence east to the line between Ranges 39 East and 40 East; thence south to the south line of Martin County; thence east to the line between Ranges 40 East and 41 East; thence south to the West Palm Beach Canal (also known as the Okeechobee Canal); thence follow said canal eastward to the mouth thereof; thence east to the shore of the Atlantic Ocean; thence northerly along the shore of the Atlantic Ocean to the point of beginning.

(3) The “Gulf” production area of this state shall encompass all of Charlotte, Collier, Glades, Hendry, and Lee counties.

(4) The “Florida SunRidge” production area of this state shall encompass all the area of the state not included within the boundaries established by subsections (2) and (3).
