September 8, 2021

**All Citrus Acreage Down 3 Percent**

Results of the annual Commercial Citrus Inventory show total citrus acreage is 407,348 acres, down 3 percent from the last survey and the lowest in a series which began in 1966. The net loss of 12,104 acres is 955 acres more than what was lost last season. New plantings at 10,448 acres are up from the previous season. All citrus trees, at 59.7 million, are down 1 percent from the previous season.

Of the 25 published counties included in the survey, 24 recorded decreases in acreage while 1 county showed an increase. Indian River county lost the most acreage, down 1,681 acres from last year. For the third consecutive season, Desoto County records the most citrus acres at 66,638 acres.

**Orange** acreage is now at 372,354 acres, down 3 percent from the previous season. The Western area continues to come in with the most orange acreage at 121,395. The Central area has the second most with 119,231 acres. The Southern area now has 113,368 acres. The remaining two areas, the Northern area and Indian River area, combined have 18,360 orange acres. Valencia acreage accounts for 60 percent of the total orange acreage, non-Valencia acreage represents 39 percent, and the remaining orange acreage is unidentified.

**Grapefruit** acreage is now at 19,908 acres, down 11 percent from last season. White grapefruit (including seedy) is 15 percent of the total with 2,900 acres, while red grapefruit is 85 percent of the total with 16,919 acres. The Indian River District has 69 percent of the total grapefruit acreage.

**Specialty fruit** acreage, at 15,086 acres, is up 3 percent from last season. Tangerines and tangelos account for 63 percent of the specialty fruit. The remaining acreage includes true lemons and other citrus acreage, with a total of 5,537 acres, or 37 percent.

### Citrus Inventory Procedures

This publication represents the results of the most recent annual Commercial Citrus Inventory survey of Florida citrus trees. The Florida Agricultural Statistics Service first began indexing citrus groves using aerial photography with the January 1966 survey. Subsequent surveys, using aerial photography, were conducted as of January every two years through 2006. In 2005, grove boundaries were digitized and saved as geodatabases in our Geographic Information System (GIS). GIS software provides tools to enhance comparative photo interpretation for grove change detection. This technology provides current tree inventory data for evaluating Florida's potential citrus production in a shorter period of time and at less cost than by ground survey methods alone.

Each change observed by the photo interpreter is followed by a ground check, which usually results in a revised tree count for the grove. Acreages can be verified using the GIS. Tree numbers are from actual tree counts or from measured acreage. Block sizes are reduced as necessary for dead trees or empty spaces, as well as barnyards, turn rows, swale ditches, and irrigation ponds.

A record for each separate planting or block is maintained in the data system. A new record is created for each new planting, and records of plantings, which no longer exist, are transferred to an inactive layer. For this inventory period, 55.9 percent of the state's total citrus acreage was visited to update the records.

Production areas were redesigned in 1986 to give greater efficiency for objective forecasting purposes. The principal change was to place all the northern freeze-prone regions in a single area and to set apart the southern flatwoods plantings. The Indian River District follows the boundary of the Indian River Marketing District. This stratification provides greater homogeneity within each sampling stratum.
