DIVISION OF PLANT INDUSTRY

Robert L. Freie, Statistician in Charge

Salvatore A. Alfieri, Jr. (Ph D), Director

ACKNOWLEDGMENT

The inventory data contained in this report were developed at the request of and with funds provided by Florida's Citrus Industry. Its leaders sought accurate information for projecting future production and recognized the requirement to maintain citrus tree and acreage inventories on a current basis.

The work was directed by the Florida Agricultural Statistics Service who supervised photography, photo interpretation, field checking, and assembling of the data. Field survey work was a continuing cooperative project of the Florida Agricultural Statistics Service and the Division of Plant Industry.

Private and public officials contributed to this work by supplying information and other assistance. Many growers supplied basic data. These contributions are sincerely appreciated.

This public document was promulgated at a cost of \$2.76 per copy to the State of Florida. It is published to inform citrus growers and others of trends in Florida citrus production. M86T11

 AERIAL PHOTOGRAPHIC SURVEY OF
 FLORIDA CITRUS GROWING AREAS

Florida Agricultural Statistics Service
 Florida Department of Agriculture and Consumer Services

SURVEY HIGHLIGHTS

The acreage of commercial citrus in Florida decreased dramatically since the 1982 census when there were 847,856 acres. As of January, 1986, there are only 624,492 acres. Most of this acreage reduction results from the series of severe freezes which occurred during the 1980's.

The gross loss of 185,598 acres during the past two years was partially offset by new plantings of 48,725 acres in the same period. The net loss of 136,873 acres is the greatest loss during any two year period since the beginning of the Tree Census Survey in 1966. The survey results show marked shifts in acreage by counties since 1984. The largest increase in total citrus acreage occurred in Hendry County with St. Lucie, Highlands, and Indian River counties following. The greatest decrease in the past two years was in Polk County with Brevard, Osceola, and Pinellas counties, in that order, also showing losses.

FLORIDA COMMERCIAL CITRUS ACREAGE

Census:	Oranges	Grape-fruit	Specialty-fruit	Total
1966	673,086	103,224	81,772	858,082
1968	713,400	119,883	97,966	931,249
1970	715,806	124,050	101,615	941,471
1972	659,418	124,142	94,459	878,019

ACREAGE CHANGES BETWEEN SURVEYS

The total tree inventory by year set as indicated in the Censuses of 1970 to 1986 is shown on page 103. From the record high 941,471 acres planted at the time of the 1970 survey, only 367,178 (39.0 percent) remain. The average gross loss for each two year period has stayed below 5.0 percent except when affected by freezes. Clearly, the most significant losses occurred in the two most

recent periods. Gross loss climbed to 18.8 percent in 1984 but even that did not adequately reflect the severe damage caused by the Christmas 1983 freeze. The 1986 census indicates that 24.4 percent of the 1984 acreage and 39.8 percent of the acreage surveyed in 1982 have been lost.

FLORIDA COMMERCIAL CITRUS ACREAGE:
CHANGES BETWEEN CENSUSES

Census	Gross loss	New plantings	Net change	Total
1966(1st census via aerial photography)				858,082
1968	13,910	87,077	+73,167	931,249
1970	26,114	36,336	+10,222	941,471
1972 1/	82,948	19,496	-63,452	878,019
1974	40,181	26,260	-13,921	864,098
1976	40,518	28,789	-11,729	852,369

1/ January freezes in 1971, 1977, 1981, 1982, 1985, and 1986. December freezes in 1983 and 1985.

SURVEY HISTORY AND PROCEDURES

This publication presents the results of the eleventh biennial survey of Florida citrus trees using aerial photography. The use of aerial photography and photo interpretation provides for completion of a survey more rapidly than with any other method; even then, about eight months of intensive effort is required to process and review photographs. Changes in groves are detected by comparative photo interpretation, followed by field checking of new and altered acreages. Changes disclosed on photographs and in field observations are used to update the previous inventory. This application of proven technology provides current tree inventory data for evaluating Florida's potential citrus production within a shorter period of time and at less cost than by ground survey methods alone.

The Florida Agricultural Statistics Service first began indexing citrus groves on aerial photography with the January, 1966 survey. The 1966 inventory report included detailed data by county, variety, and year set; and the survey was designed for quick and economical updating. Subsequent surveys, using aerial photography, were conducted as of January every two years including the latest for 1986.

AERIAL PHOTOGRAPHY

The same three-mile wide flight lines established for the January, 1966 survey were photographed on each of the succeeding flights. Some additional coverage has been added as citrus acreage has been planted farther south. The area, photographed at a scale of 1 inch to 2,500 feet, now covers almost 14,000 square miles, and includes more than 99 percent of the commercial citrus acreage in Florida. Photographing for the latest survey began the first of November, 1985 and was completed by the end of December.

NON-PHOTOGRAPHED AREAS

Flight lines are laid out for maximum grove coverage at minimum cost. Since it is not economically feasible to photograph the approximately 1,000 scattered acres of outlying citrus, supplemental photography was purchased, where available. In the absence of photography, the outlying acreage was mapped and thoroughly checked by ground survey teams.

For quality control and to locate any newly established groves, a light airplane was used to strip fly those areas of the citrus belt not actually photographed.

PHOTO INTERPRETATION

Stereoscopic viewers enabled interpreters to examine two photo contact prints simultaneously, to detect changes occurring during 1984 and 1985. Altered ground characteristics result in a loss of the three-dimensional effect, making such changes as new groves, additions to existing groves, pushed groves, and other significant alterations quickly

identifiable. In addition to stereo examination, a light table was used to visually compare replacement cronaflex enlargements with the previous master transparencies on which groves are delineated.

FIELD INSPECTION

On January 6, 1986, field crews began ground checking sites that had been questioned by photo interpreters on the new photography. All blocks showing changes since the 1984 flight were visited. Crews identified varieties in blocks where trees were too young in earlier surveys. Field work was completed the first of August.

GROVE INDEXING

Following field inspection, photo interpreters delineated and indexed all new citrus groves and grove changes by variety blocks on cronaflex enlargements of aerial photographs. Polar planimeters were used to measure acres of new and altered citrus groves. Acres are computed from the combination of tree numbers and tree spacing as measured by fieldmen. All statistical information--variety, year set, acreage, tree numbers and identifying features --was then keyed into a computer system and retained for future use.

There are approximately 110,000 variety blocks, all of which were summarized by computer and retained on magnetic tape. Printed tables came off the computer as camera-ready copy, all accomplished with a minimum clerical staff.

COMMERCIAL GROVES, MINIMUM 50 TREES

The data in this report relate to commercial groves, those containing a minimum of 50 trees from which fruit is generally sold. In addition, the grove must have been cultivated and, if cold damaged, have viable growth in the limb scaffold.

NET ACRES IN COMMERCIAL GROVES

The acreage shown is that land which is actually planted with citrus trees. Bayheads,

ponds, sinkholes, drainage canals, lateral and swale ditches, roads, turn rows and wide middles were excluded. Where vacancies within a commercial grove were numerous, they were counted and acreage was then reduced to equivalent net acres of commercial trees. These groves will be revisited every two years to determine acreage reset.

CHRONOLOGICAL AGE USED

Trees are listed by the calendar "year in which set," even though they may have been severely pruned. Grove managers' records were used, when available, to establish age. Age of young trees is estimated from both trunk circumference and tree height.

RESET TREES

The photo interpreters send ground crews to all groves where there appear to be new trees. If the inspector finds a significant number of new trees a count is made and the older trees or vacancies reduced accordingly. The measured block acreage is then divided between the two ages of trees, based on this new count of trees.

INTERSET AND MULTI RESET BLOCKS

In blocks of citrus which are interset, acreage is proportionate to the number of trees of each variety or type, and/or age in the block. In the multi reset blocks, two or more resets are planted in one direction for each tree removed. Because of the variable distance between trees the spacing must be averaged. The spacing in one direction remains constant for grove travel.

UNIDENTIFIED TREES

Identification of citrus varieties generally depends on the presence of fruit. Many young groves visited for the first time are necessarily indexed as unidentified until fruit is available for variety determination. Acreage and trees in this report listed as "unidentified" will be resurveyed and classified by variety in the next census.

The unidentified trees and acres are listed by year set and by county under all Florida citrus. They are also included in the all orange or all grapefruit totals.

OTHER CITRUS

Data itemized under the heading of other citrus include minor types and varieties, such as Ponkans, Satsumas, K-Early Citrus, Kumquats, Calamondines, etc. They are not reported individually or by year set within county due to lack of space.

ZERO ACRES AND TREES

The various tables in this report were computer summarized and printed. Variety totals were computer rounded to the nearest acre and one hundred trees. All item totals that fell below these parameters were listed as zeros. For this reason, users are cautioned that zero cells in the data tables could actually have a positive entry, but would be less than one half acre and below 50 trees.

PLANT INDUSTRY ASSISTANCE

Much of the credit for the success of this survey goes to the Division of Plant Industry, which supplied eight trained citrus technologists with 4-wheel drive vehicles to work exclusively on the tree census field inspection team for more than seven consecutive months. Fieldmen from the objective survey crew of the Agricultural Statistics Service completed this inspection team.

POST SURVEY TREE COUNTING

Those badly frozen areas north of Highway 60 will be visited between flights for possible changes. Another item to be emphasized is the identification of the four year old plantings that are to be included in next year's objective count surveys. Also, all groves that had vacancies this past survey will be visited prior to the 1988 flight. There will be increasing dependency on the Division of Plant Industry fieldmen to help resurvey in their respective areas.
