STATISTICS SERVICE**

DIVISION OF PLANT INDUSTRY

Robert L. Freie, State Statistician

Richard D. Gaskalla, Director

ACKNOWLEDGMENT

The inventory data contained in this report were developed at the request of and with funds provided by Florida's Citrus Industry. Its leaders sought accurate information for projecting future production and recognized the requirement to maintain citrus tree and acreage inventories on a current basis.

The work was directed by the Florida Agricultural Statistics Service who supervised photography, photo interpretation, field checking, and assembly of the data. Field survey work was a continuing cooperative project of the Florida Agricultural Statistics Service and the Division of Plant Industry.

Private and public officials contributed to this work by supplying information and other assistance. Many growers supplied basic data. These contributions are sincerely appreciated.

SURVEY HIGHLIGHTS AND PROCEDURES

The acreage of commercial citrus in Florida increased to 791,290 acres from 732,767 acres in 1990. This 8 percent increase in total acreage is largely attributed to the continued high rate of new plantings in the Southern and East Coast areas.

There were 133,227 acres planted in 1990 and 1991. These new plantings were offset by 74,704 acres lost to attrition. The 58,523 net gain in acreage is the third largest increase for the two year tree census period since the first survey in 1966.

Hendry County, with an 13,642 net acreage increase, leads all citrus producing counties in acreage gained. Collier was second followed by St. Lucie and DeSoto. Hendry County's 1990 and 1991 plantings were 18,455 acres compared to 21,493 acres planted in 1988 and 1989. Polk County incurred the greatest acreage loss. Palm Beach and Indian River counties were a close second and third in losses.

FLORIDA COMMERCIAL CITRUS ACREAGE

Census year	Orange	Grape-fruit	Specialty fruit	Total
1966	673,086	103,224	81,772	858,082

ACREAGE CHANGE BETWEEN SURVEYS

The total tree inventory by year set as indicated in the Censuses of 1974 to 1992 is shown on page 109. From the record high 941,471 acres planted at the time of the 1970 survey, only 226,587 (24 percent) remain. The 1992 Census indicates that only 310,323 acres (37 percent) remain from the 845,283 reported in the 1980 Census. The gross acreage decline in the past two years is 10.2 percent (page 109) of the 1990 inventory.

SURVEY HISTORY

This publication presents the results of the fourteenth biennial survey of Florida citrus trees using aerial photography. The use of aerial photography and photo interpretation provides for completion of a survey more rapidly than with other methods; even then, about eight months of intensive effort is required to process and review photographs. Changes in groves are detected by comparative photo interpretation, followed by field checking of new and altered acreage. Changes disclosed on photographs and in field observations are used to update the previous inventory. This application of proven technology provides current tree inventory data for evaluating Florida's potential citrus production within a shorter period of time and at less cost than by ground survey methods alone.

The Florida Agricultural Statistics Service first began indexing citrus groves on aerial photography with the January, 1966 survey. The 1966 inventory report included detailed data by county, variety, and year set; and the survey was designed for quick and economical updating. Subsequent surveys, using aerial photography, were conducted as of January every two years including the latest for 1992.

AERIAL PHOTOGRAPHY

The same three-mile wide flight lines established for the January 1966 survey were photographed on each of the succeeding flights. Some additional coverage has been added as citrus acreage has extended farther south. The area, photographed at a scale of 1 inch to 2,500 feet, now covers almost 14,000 square miles and includes more than 99 percent of the commercial citrus acreage in Florida. Photographing for the latest survey began the first of November 1991 and was completed by the end of March.

NON-PHOTOGRAPHED AREAS

Flight lines are laid out for maximum grove coverage at minimum cost. Since it is not economically feasible to photograph the few hundred scattered acres of outlying citrus, supplemental photography has been purchased, where available. In the absence of photography, the outlying acreage was mapped and thoroughly checked by ground survey teams.

PHOTO INTERPRETATION

Stereoscopic viewers enabled interpreters to examine current and previous photo contact prints simultaneously to detect changes occurring during 1990 and 1991. Altered ground characteristics result in a loss of the three-dimensional effect, making such changes as new groves, additions to existing groves, pushed groves, and other significant alterations quickly identifiable. In addition to stereo examination, a light table was used to visually compare replacement cronaflex enlargements with the previous master transparencies on which groves are delineated. Questionable observations were verified by field inspection.

FIELD INSPECTION

On January 8, 1992, field crews began ground checking sites that had been questioned by photo interpreters on the new photography. All blocks showing changes since the 1990 flight were visited. Crews also identified varieties in blocks where trees were too young in earlier surveys. Field work was completed the first week of August.

GROVE INDEXING

Following field inspection, photo interpreters delineated and indexed all new citrus groves and grove changes by variety blocks on cronaflex enlargements of aerial photographs. Digital planimeters were used to measure acres of new and altered citrus groves. Acres were computed from the combination of tree numbers and

tree spacings as measured by field personnel. All statistical information (variety, year set, acreage, tree numbers and identifying features) was then keyed into a data base and retained for future use.

There are approximately 152,000 variety blocks, all of which were summarized by computer and retained on magnetic tape. The computer produces a camera-ready copy of the printed tables.

COMMERCIAL GROVES, MINIMUM 50 TREES

The data in this report relate to commercial groves, those containing a minimum of 50 trees from which fruit is generally sold. In addition, the grove must have been cultivated and, if cold damaged, have viable growth in the limb scaffold.

NET ACRES IN COMMERCIAL GROVES

The acreage shown is land which is actually planted with citrus trees. Bayheads, ponds, sinkholes, drainage canals, lateral and swale ditches, roads, turn rows and wide middles were excluded. Where vacancies within a commercial grove were numerous, they were counted and acreage was then reduced to equivalent net acres of commercial trees. These groves will be revisited in subsequent censuses to determine acreage reset.

CHRONOLOGICAL AGE USED

Trees are listed by the calendar "year in which set," even though they may have been severely pruned. Grove managers' records were used, when available, to establish age. Age of young trees is estimated from both trunk circumference and tree height.

RESET TREES

The photo interpreters identify all groves where there appear to be new trees. These groves are then visited by ground crews. If the inspector finds a significant number of new trees, a count is made and the older trees or vacancies reduced accordingly. Based on this new count of trees, the measured block acreage is then divided between the two ages of trees.

INTERSET AND MULTI RESET BLOCKS

In blocks of citrus which are interset, acreage is proportionate to the number of trees of each variety or type, and/or age in the block. In the multi reset blocks, two or more resets are planted in one location for each tree removed. Because of the variable distance between trees the spacing must be averaged. The spacing between rows in one direction remains constant for grove travel.

UNIDENTIFIED TREES

Identification of citrus varieties generally depends on the presence of fruit. Many young groves visited for the first time are indexed as unidentified until fruit is available for variety determination. Acreage and trees in this report listed as "unidentified" will be resurveyed and classified by variety in the next census.

The unidentified trees and acres are listed by year set and by county under all Florida citrus. They are also included in the all orange or all grapefruit totals.

OTHER CITRUS

Data itemized under the heading of other citrus include minor types and varieties, such as Ponkans, Satsumas, K-Early Citrus, Kumquats, etc. They are not reported individually or by year set within county due to lack of space.

ZERO ACRES AND TREES

Variety totals were computer rounded to the nearest acre and one hundred trees. All item totals that fell below these parameters were listed as zero. For this reason,

users are cautioned that zero cells in the data tables could actually have a positive entry, but would be less than one half acre and below 50 trees.

PLANT INDUSTRY ASSISTANCE

Much of the credit for the completion of this survey goes to the Division of Plant Industry, which supplied eight trained citrus technologists with 4-wheel drive vehicles to work on the tree census field inspection team. Assistance was also provided by personnel from the Division of Fruit and Vegetable.

POST SURVEY TREE COUNTING

Resurveying is a continuing process between flights. Quality checks for accurate variety counts will be emphasized as well as the identification of the three year old plantings that are to be included in next year's objective count surveys. Also, all groves that had vacancies this past survey will be visited prior to the 1994 flight.
