ACKNOWLEDGEMENTS

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida are official State and USDA estimates prepared by the Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA Statistical Reporting Service. Shipment and market price data are from the Marketing Bureau Section and USDA's Agricultural Marketing Service. Canned and frozen pack statistics were compiled by the Florida Cannery Association and the National Cannery Association. Where data are from other sources, appropriate footnotes appear.

Records of the Citrus and Vegetable Inspection Division of the Florida Department of Agriculture were employed in production and utilization estimates. The Growers Administrative Committee assisted in developing production estimates.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contribution is sincerely appreciated.

CITRUS SUMMARY

PRODUCTION

Florida's citrus production in 1967-68 declined 27 percent from the record 1966-67 crop. The season began in mid-February with groves flushed in new growth. Trees were approaching full bloom following what had been a very mild winter, when on Saturday night, the 25th of February, the coldest air mass that late in the winter in 30 years, hit Central Florida. The effects were extremely variable but the Upper Interior and Northern West Coast areas were hardest hit. In these areas and cold locations in other areas of the citrus belt had defoliation, loss of bloom buds and minor wood damage was prominent. Following the cold wave, bloom lingered on for about 6 weeks, varying considerably between areas, varieties and even within groves. Absence of rainfall following the cold delayed new flush and bloom bud formation. Irrigation was used extensively late May when summer showers began to bring relief. Adequate moisture following the prolonged drought shocked trees into additional bloom. June late bloom was abundant in cold locations.

Forecast surveys showed averages of fruit per tree for East Coast and Lower Interior areas were off 28 percent, while Upper Interior and West Coast areas were down nearly 50 percent from 1966-67. Late bloom fruit was heavy in many groves. For most varieties the large fruit size helped to offset fewer fruit per tree. The industry packed 83,697,600 gallons of orange concentrate. Yield of FCOJ per box of early and midseason oranges was slightly above the 1966-67 crop but Valencias averaged lower due in part to late bloom fruit. Processors used 83 percent of the round orange crop and 55 percent of the grapefruit.

California's citrus crop was seriously effected by cold weather. A mid-December cold wave damaged the crop so severely that final pickout was second lowest in over 25 years. Central California area was most seriously damaged and fresh shipments were cut in half. Losses were much less in southern portion with no serious loss reported in the Desert Valleys. Total crop size at 39,020,000 boxes for 1967-68 was only slightly larger than the low crop in 1961-62, when just 38,840,000 boxes were harvested. Tree damage was slight and preliminary estimate for 1968-69 indicates a rapid return to normal production.

Arizona's production continues to increase and for the third year in a row set new records. In 1967-68 harvest was 10,260,000 boxes, more than one and a half million box increase above the 1966-67 crop. Acres of bearing citrus, though reasonably small, continue to increase.

The Texas citrus crop was hit by Hurricane Beulah in late September, which was partially responsible for reduction in harvest to little more than half the 1966-67 season. No official measure of bearing acreage has been made available since the late fifties, so it is not possible to determine the extent of change. However, Texas is in the process of conducting a tree census.

BEARING ACREAGE

In the 1967-68 season there were 706,130 acres of producing citrus, 4 years old and older, in Florida's commercial citrus groves. Of this, 557,639 acres are oranges which constitute 79.0 percent of the total acreage. There are 283,422 acres or 50.8 percent early and midseason varieties and late varieties has 273,581 acres, 49.2 percent of all round oranges. Grapefruit constitute the next largest segment with 87,517 acres, 12.4 percent of all commercial citrus acreage.

Specialty varieties are beginning to make up a sizable

share of bearing acreage with recent introduction of several new varieties that have fresh fruit appeal. Temples with 18,277 acres, Tangelos 10,551 acres, Tangerines 14,848 and Murcotts have 7,314 acres. Together these constitute 7.2 percent of total bearing citrus acreage. Acid and miscellaneous varieties make up the remaining 9,984 acres of bearing citrus.

NON-BEARING ACREAGE

As of December 1967, there were 225,119 acres of non-bearing citrus trees, younger than 4 years, set in Florida. This consists of 155,761 acres of oranges; 32,366 acres of grapefruit; 6,316 acres of Temples; 13,702 acres of Tangelos; 6,249 acres of Tangerines; and 3,333 acres of Murcotts. There are 5,984 acres of Limes and Lemons and 1,408 acres of miscellaneous commercial varieties. Planting which begun a downward trend in 1966 slowed even more in 1967. Records show that acreage set during the last two years combine was slightly above the peak year 1965, when over 85,000 acres were set.

Aerial photography was again used at end of 1967 to update Florida's commercial citrus inventory. Current plans call for a reflight every second year to enumerate new planting and remove abandoned and pushed out acreage.

PRICES

Reduced production boosted prices received for Florida's citrus in 1967-68. That portion of the 1966-67 processed products that were unsold took a sizable price increase when it was learned from the October forecast that production during 1967-68 would be down. Growers having fruit in co-operatives and participation plans profited most from these late sales. The preliminary crop value for 1966-67 was revised upwards rather sharply, from 124,573,000 dollars to 175,637,000 dollars.

VALUE

Florida, All Citrus: Value of Sale, On-Tree Crop Years 1958-59 through 1967-68

Year	Value	Year	Value
1958-59	\$ 289,769,000	1963-64	\$ 331,889,000
1959-60	220,021,000	1964-65	271,117,000
1960-61	296,516,000	1965-66	222,418,000
1961-62	247,258,000	1966-67	175,637,000
1962-63	247,785,000	1967-68	296,205,000

Note - Net contents of box varies. The Florida citrus code defines an equivalent standard box of fruit as 90 pounds for oranges and Tangelos, 85 pounds for grapefruit, 95 pounds for Tangerines, and 80 pounds for Limes. These weights have been used in these statistics for Florida. Texas average weights are 90 pounds for oranges and 80 pounds for grapefruit. California and Arizona use a smaller box. California weight averages are: oranges, 75 pounds; grapefruit, 65 pounds and lemons, 76 pounds. Arizona average weights are: oranges, 75 pounds; grapefruit, 64 pounds; lemons, 76 pounds.

1968 FLORIDA CITRUS SUMMARY

Pages 1 (Value Table Only), 17, 18, 19, 20, 21, 22
and 23 were in error. Corrections have been made on the
attached pages which should be substituted for those in the
Summary.

CITRUS SUMMARY

PRODUCTION

Florida's citrus production in 1967-68 declined 27 percent from the record 1966-67 crop. The season began in mid-February with groves flushed in new growth. Trees were approaching full bloom following what had been a very mild winter, when on Saturday night, the 25th of February, the coldest air mass that late in the winter in 30 years, hit Central Florida. The effects were extremely variable but the Upper Interior and Northern West Coast areas were hardest hit. In these areas and cold locations in other areas of the citrus belt had defoliation, loss of bloom buds and minor wood damage was prominent. Following the cold wave, bloom lingered on for about 6 weeks, varying considerably between areas, varieties and even within groves. Absence of rainfall following the cold delayed new flush and bloom bud formation. Irrigation was used extensively late May when summer showers began to bring relief. Adequate moisture following the prolonged drought shocked trees into additional bloom, June late bloom was abundant in cold locations.

Forecast surveys showed averages of fruit per tree for East Coast and Lower Interior areas were off 28 percent, while Upper Interior and West Coast areas were down nearly 50 percent from 1966-67. Late bloom fruit was heavy in many groves. For most varieties the large fruit size helped to offset fewer fruit per tree. The industry packed 83,697,600 gallons of orange concentrate. Yield of FCOJ per box of early and midseason oranges was slightly above the 1966-67 crop but Valencias averaged lower due in part to late bloom fruit. Processors used 83 percent of the round orange crop and 55 percent of the grapefruit.

California's citrus crop was seriously effected by cold weather. A mid-December cold wave damaged the crop so severely that final pickout was second lowest in over 25 years. Central California area was most seriously damaged and fresh shipments were cut in half. Losses were much less in southern portion with no serious loss reported in the Desert Valleys. Total crop size at 39,020,000 boxes for 1967-68 was only slightly larger than the low crop in 1961-62, when just 38,840,000 boxes were harvested. Tree damage was slight and preliminary estimate for 1968-69 indicates a rapid return to normal production.

Arizona's production continues to increase and for the third year in a row set new records. In 1967-68 harvest was 10,260,000 boxes, more than one and a half million box increase above the 1966-67 crop. Acres of bearing citrus, though reasonably small, continue to increase.

The Texas citrus crop was hit by Hurricane Beulah in late September, which was partially responsible for reduction in harvest to little more than half the 1966-67 season. No official measure of bearing acreage has been made available since the late fifties, so it is not possible to determine the extent of change. However, Texas is in the process of conducting a tree census.

BEARING ACREAGE

In the 1967-68 season there were 706,130 acres of producing citrus, 4 years old and older, in Florida's commercial citrus groves. Of this, 557,639 acres are oranges which constitute 79.0 percent of the total acreage. There are 283,422 acres or 50.8 percent early and midseason varieties and late varieties has 273,581 acres, 49.2 percent of all round oranges. Grapefruit constitute the next largest segment with 87,517 acres, 12.4 percent of all commercial citrus acreage.

Specialty varieties are beginning to make up a sizable

share of bearing acreage with recent introduction of several new varieties that have fresh fruit appeal. Temples with 18,277 acres, Tangelos 10,551 acres, Tangerines 14,848 and Murcotts have 7,314 acres. Together these constitute 7.2 percent of total bearing citrus acreage. Acid and miscellaneous varieties make up the remaining 9,984 acres of bearing citrus.

NON-BEARING ACREAGE

As of December 1967, there were 225,119 acres of non-bearing citrus trees, younger than 4 years, set in Florida. This consists of 155,761 acres of oranges; 32,366 acres of grapefruit; 6,316 acres of Temples; 13,702 acres of Tangelos; 6,249 acres of Tangerines; and 3,333 acres of Murcotts. There are 5,984 acres of Limes and Lemons and 1,408 acres of miscellaneous commercial varieties. Planting which began a downward trend in 1966 slowed even more in 1967. Records show that acreage set during the last two years combine was slightly above the peak year 1965, when over 85,000 acres were set.

Aerial photography was again used at end of 1967 to update Florida's commercial citrus inventory. Current plans call for a reflight every second year to enumerate new planting and remove abandoned and pushed out acreage.

PRICES

Reduced production boosted prices received for Florida's citrus in 1967-68. That portion of the 1966-67 processed products that were unsold took a sizable price increase when it was learned from the October forecast that production during 1967-68 would be down. Growers having fruit in co-operatives and participation plans profited most from these late sales. The preliminary crop value for 1966-67 was revised upwards rather sharply, from 124,573,000 dollars to 175,457,000 dollars.

VALUE

Florida, All Citrus: Value of Sale, On-Tree Crop Years 1958-59 through 1967-68

Year	Value	Year	Value
1958-59	\$ 289,769,000	1963-64	\$ 332,063,000
1959-60	220,021,000	1964-65	270,804,000
1960-61	296,516,000	1965-66	222,027,000
1961-62	247,348,000	1966-67	175,457,000
1962-63	247,793,000	1967-68	302,482,000

Note - Net contents of box varies. The Florida citrus code defines an equivalent standard box of fruit as 90 pounds for oranges and Tangelos, 85 pounds for grapefruit, 95 pounds for Tangerines, and 80 pounds for Limes. These weights have been used in these statistics for Florida. Texas average weights are 90 pounds for oranges and 80 pounds for grapefruit. California and Arizona use a smaller box. California weight averages are: oranges, 75 pounds; grapefruit, 65 pounds and lemons, 76 pounds. Arizona average weights are: oranges, 75 pounds; grapefruit, 64 pounds; lemons, 76 pounds.
