#### ACKNOWLEDGEMENTS

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida are official State and USDA estimates prepared by the Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA Statistical Reporting Service. Shipment and market price data are from the Marketing Bureau Section and USDA's Agricultural Marketing Service. Canned and frozen pack statistics were compiled by the Florida Canners Association and the National Canners Association. Where data are from other sources, appropriate footnotes appear.

Records of the Citrus and Vegetable Inspection Division of the Florida Department of Agriculture were employed in production and utilization estimates. The Growers Administrative Committee assisted in developing production estimates.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contribution is sincerely appreciated.

Publications Committee,

**CITRUS SUMMARY**

**PRODUCTION**

Florida's 1969-70 citrus season began with groves in good condition, but was characterized by greater than normal amounts of rainfall in the fall and early winter months. Set of fruit was up sharply from the previous season but droppage was heavy. Fruit splitting in oranges began in late August and was sustained at a record level through November. A reduction in the December orange forecast of 9,000,000 boxes was primarily the result of fruit losses. Droppage of fruit from other types was excessive also.

Early season maturity test indicated that yield from the 1969-70 orange crop would be just average and the quality was further eroded by a mid-winter cold wave that dropped temperatures to below freezing the mornings of January 8 to 11. Accelerated and clean harvest of cold damaged early and mid-season oranges held the box loss to a minimum. Juice yield was reduced somewhat by the cold weather. Tree damage generally was insignificant.

Final yield of 45° Brix concentrate was 1.24 gallons of FCOJ per box, below normal, but up 9 percent from the 1968-69 season when the yield was just 1.13 gallons per box. Season pack of FCOJ was 124,947,000, up sharply from 103,750,000 gallons packed in 1968-69, but smaller than the record pack in 1966-67 of 131,755,000 gallons of FCOJ. The 100,739,000 boxes used in 1969-70 was the largest one year volume ever processed into concentrate, topping the 1966-67 season by 4 million boxes. During the 1969-70 season processors used 90 percent of the round orange harvest.

Good moisture and warm temperatures in March brought out a flush of new leaf growth and bloom buds. The bloom was uniform and peaked near normal season, between the 15th and 25th of March. Supplemental irrigation kept trees in good condition through 6 to 7 weeks of relatively dry weather in the late spring. Growing conditions were near ideal through the summer and fruit sized well while fruit droppage was just nominal.

California's groves were generally in good condition as the 1969-70 harvest began. However, in southern California they still showed the effects of the previous season's mid-winter freeze and flooding. Fruit harvest began somewhat later than normal because of slower maturity. Freezing temperatures once again hit California's fruit belt the last two days of December resulting in fruit loss and lowered quality. The loss was especially noticeable in Valencias, as large quantities (44 percent of the crop) were diverted to processors.

Arizona's orange crop was down from the previous season's record crop. Freezes in late December and early January, which did considerable damage in the Yuma area, was one of the major reasons for the reduction. Damage to grapefruit was minimal, but growers were plagued with fruit considerably smaller than normal. The lemon harvest was down 20 percent from the 1968-69 season. Smaller fruit sizes and light sets in many areas were responsible for the decline.

Texas harvested its largest crop of citrus fruit (12.3 million boxes) since the serious of severe freezes 20 years ago. Another cold wave invaded the Texas citrus belt in January but did little permanent damage to the trees, and fruit loss was moderate. Most of the early and mid-season oranges had been harvested. Following the low temperatures, fruit drop on Valencias was much heavier and the volume of fruit diverted to processors continued increasing. More than 40 percent of the orange crop and nearly 40 percent of the grapefruit harvest went to processing plants.

**BEARING ACREAGE IN FLORIDA**

In 1969-70 there were 817,138 acres of producing citrus (4 years old and older) in Florida's commercial citrus groves. Of this 636,128 acres or 77.8 percent, are oranges. There were 332,051 acres or 52.2 percent early and midseason varieties and 303,717 acres or 47.8 percent, Valencia oranges. Grapefruit constitute the next largest segment with 98,702 acres, 12.1 percent of the bearing commercial citrus acreage.

Specialty varieties made up 10.1 percent of the bearing acreage. Temples lead with 21,779 acres. There were 18,119 acres, of Tangelos, 18,577 Tangerines, and 9,182 acres of Murcotts. Acid and miscellaneous varieties make up the remaining 14,651 acres.

**AERIAL PHOTOGRAPHY**

Aerial photography is used to survey Florida's commercial citrus acreage. The latest flight was accomplished as of December 1969. Photos were interpreted using stereoscopes, then ground checked for changes in grove character. New plantings were enumerated, and abandoned and pushed acreages were removed. Ground checking was completed in early June and a summary published in mid-summer.

**PRICES**

On-tree prices for oranges during the 1969-70 season continued to decline. Near record pack at processing plants, coupled with a sizeable carryover from 1968-69, was the contributing factor in the sagging price. The anticipated large volume of oranges for 1969-70 dropped the value for stocks on hand. Final result from the 1968-69 season was lower payments to growers for oranges processed than originally indicated by the cash market. This downward trend continued into the 1969-70 season with a preliminary season average on-tree price of just \$1.13 per box for processed fruit.

The demand for grapefruit was good and the volume harvested was somewhat less in 1969-70 than in 1968-69. Fruit quality too, was very good. The preliminary price in 1969-70 for all grapefruit on tree was \$1.69 all method of sales, up from the final revised price of \$0.96 for the 1968-69 crop.

The on-tree value of fruit sold in 1969-70 was 248,541,000 down 13 percent from the 1968-69 value.

**VALUE**

Year	Value	Year	Value
1960-61	\$ 297,499,000	1965-66	\$ 223,435,000
1961-62	248,267,000	1966-67	177,049,000
1962-63	248,170,000	1967-68	305,775,000
1963-64	333,440,000	1968-69	284,509,000
1964-65	271,848,000	1969-70	248,541,000

Note - Net contents of box varies. The Florida citrus code defines an equivalent standard box of fruit as 90 pounds for oranges, Temples, Tangelos, Murcotts and Lemons. Weight for Limes is 80 pounds, grapefruit is 85 pounds and 95 pounds for Tangerines. Texas average weights are 90 pounds for oranges and 80 pounds for grapefruit. California weight averages are: oranges, 75 pounds; grapefruit, 65 pounds and lemons, 76 pounds; grapefruit, 64 pounds, lemons 76 pounds.

### HISTORY OF FLORIDA'S CITRUS INDUSTRY

The citrus tree is a native of the Orient. From this area it was carried ever westward by man, to India, to the Mediterranean and on across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Haiti. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were growing in abundance around St. Augustine at that time. Early settlers in Florida some two centuries later found wild citrus trees scattered over the State. One of the oldest cultivated groves planted in Florida (Hume, 1926, p. 95) is thought to be the Don Phillippe grove in Pinellas County, planted sometime between 1809 and 1820. Several of the original trees still remain. It is believed that Duncan Grapefruit originated from these trees. The site is now Don Phillippe Park just north of Safety Harbor.

Citrus production in Florida had reached the all time high to more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. Since that time the volume steadily increased and by the mid-forties Florida was producing more than half the nation's citrus fruit supply. Florida surpassed all other States in bearing citrus acreage in 1932-33 with 265,400 acres, which accounted for 46 percent of the United States total bearing acreage. By the mid-sixties Florida had approximately two-thirds of the nations bearing citrus acreage.

Table 53 -- Other States' Citrus: Acreage By States, Types and Age Groups
