Statistical Reporting Service

ACKNOWLEDGEMENTS

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida are official State and USDA estimates prepared by the Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA Statistical Reporting Service. Shipment and market price data are from the Bureau of Market News and USDA's Agricultural Marketing Service. Canned and frozen pack statistics were compiled by the Florida Canners Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetable Inspection, Florida Department of Agriculture and Consumer Services were employed in production and utilization estimates. The Growers Administrative Committee assisted in assembling these data.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The report was assembled under the direction of Paul E. Shuler and James W. Todd of the Florida Crop and Livestock Reporting Service, and E. F. Scarborough, Bureau of Market News.

CHARACTER OF THE WEATHER FOR SELECTED AREAS OF FLORIDA
NOVEMBER, 1972-MARCH, 1973

Central Florida

In contrast to the last two winter seasons the weather this season was nearly ideal for agriculturists. There was sufficient cool weather to keep the citrus trees in a desirable state of semi-dormancy and enhance fruit maturity and color, yet the coldest periods required the use of cold protection devices in only the most unfavorable grove locations. Rainfall was sufficient and generally well distributed in space and time so that citrus went through the winter in a state of good health without the need of irrigation, and rain was of great importance in preventing potentially critically low temperatures on several nights.

NOVEMBER. The season opened warm and remained such for the first 2 weeks except for a very brief cool period around the eighth when some minima were in the 40's. The last half of the month temperatures were 5 to 10 degrees below normal with most maxima in the 60's or 70's and minima in the 40's and 50's. Rainfall was generally plentiful. A few isolated locations received less than 2 inches, most of the region received 4 to 5 inches.

DECEMBER. Much of the month was marked by mild weather with some cold front penetrating into the area. The brief warm period at the end of November abruptly ended on December 1 with the passage of a cold front. On December 2, temperatures in the colder locations fell to the middle and high 30's for the first time this season. On the 16th a rather strong cold front moved rapidly down the state and by December 17 minima were freezing or below for the first time this season in the area which ranged generally 28-32 degrees for minima. Little frost was reported due to winds. Again around Christmas colder air came in and stayed until the last of December. The 28th was the coldest morning of the latter series with minima ranging 29-34 degrees. Frost was general in Central Florida for the first time this season. Rainfall for the month averaged 2-3 inches, however, some locations received less and supplemental irrigation was necessary.

JANUARY. There was so much frontal activity and storm activity in and around Florida during the month that it closed out as the wettest month of the season. Rainfall totals were generally 4 to 6 inches with measurements in excess of 7 inches not uncommon. The first cold air mass of January came in on January 11 and lingered until the 17th during which there were three consecutive days of minima 30 degrees or lower, January 13-14-15. The 14th was the coldest when the minima ranged mostly 26-30 degrees with some low as 24 and there was heavy frost. Again on the morning of the 30th temperatures got down to 26 to 30 degrees and frost was not as heavy or widespread.

FEBRUARY. The month opened mild and was punctuated by a few additional brief mild periods, but as a whole, it was the coldest month of the season. However, there were no critically cold nights for citrus or hardy crops. Average temperatures were below normal essentially the entire month having ranged from slightly below at the end of the month to as much as 10 degrees below normal during the period February 17-23. Rainfall totals were generally only about one-half of those for January which was adequate for most agricultural needs.

MARCH. The first half of the month was unseasonably warm with summertime temperatures prevalent on many days. The last half was near or slightly below normal. Rainfall totals were generally 3 to 6 inches over most of the area but the greatest percentage of the total occurred in the heavy rains on the 25th.

South Florida

The 1972-73 season was the second consecutive season of almost continuously favorable weather conditions for the production of agricultural products in South Florida. Precipitation averaged 3 to 5 inches above normal for the season (November through March), and was generally well spaced, thus providing maximum benefit and causing little, if any damage. Temperatures averaged from 2 to 4 degrees above normal for the season, and also averaged above normal for all months, except February, when temperatures averaged about 5 degrees below normal. There were only 15 "cold nights" (when temperatures reached 36 degrees or lower) in South Florida, and only five of these cold nights had temperatures of 32 degrees or below. Frost was reported on only six nights during the period November through March. A notable feature was a cold spell in April when frost was reported in the Everglades District on the mornings of the 11th and 12th. Also interesting was the fact that the Lower East Coast District did not record a single night of 32 degrees or below during the entire season. The lowest temperatures in South Florida was 27 degrees which occurred on December 28 in the Indian River District, and on January 14 in the Everglades District. In the Lower East Coast District the lowest temperature of 33 degrees occurred on January 30. Along the East Coast farming areas strong winds probably caused more damage than the patchy frost.

NOVEMBER. Temperatures averaged 1 to 3 degrees above normal and rainfall ranged from 2 to 5 inches above normal. The western third of South Florida was wet, with rainfall amounts ranging from 3 to more than 5 inches above normal, while the mid-section ranged from 1 to 2 inches above normal and the East Coast sections ranged from 2 to 4 inches above normal.

DECEMBER. Temperatures ranged from 1 to 3 degrees above normal and rainfall ranged near normal, except for the East Coastal sections, where rainfall was about 1 inch above normal. Moderate to strong winds from the 16th through the 21st caused about as much damage to crops as the frost or freezing temperatures on the morning of the 28th. The lowest temperature of the season, 27 degrees, was recorded in the Indian River District on the morning of the 28th.

JANUARY. Temperatures were slightly above normal and rainfall averaged 1 to 2 inches above normal. Rainfall was heaviest in the Indian River and Kissimmee Valley Districts. Strong winds were experienced over South Florida on the 12th, 28th, 29th, and 30th. Scattered frost occurred in the Everglades District on the 14th and 30th. However, higher winds along the coastal areas prevented frost formation. Rains were generally well spaced and beneficial in most areas.

FEBRUARY. It was cool and rainfall was normal. Mean temperatures averaged from 3 to 5 degrees below normal over all of South Florida. However, there were no severe cold spells and frost was only reported on two mornings (12th and 22nd) in the colder locations of the Everglades District. Strong winds occurred on the 4th, 5th, 10th and 11th. Rainfall was adequate and averaged near normal at many places.

MARCH. It was warm and humid. Temperatures averaged 3 to 5 degrees above normal over South Florida. Unseasonably warm weather prevailed through the 16th. A cold front passed over South Florida on the 17th and temperatures were nearly normal for the remainder of the month. Rainfall was interspersed during the month and averaged near normal in most farming areas.

1971-72 PRODUCTION SUMMARY

Florida's 1972-73 season started in early September with first shipments of grapefruit. Groves generally were in good condition at the beginning of the season as a result of the previous mild winter. A tremendous bloom in late March and early April, coupled with no frosts in late spring or other adverse factors, resulted in an excellent fruit set. Trees of all ages had large quantities of little fruit. By early summer, it was apparent there was to be a large crop that fall.

The October 12, 1972, all orange forecast was for 174.0 million boxes, an all-time record. Grapefruit production was estimated at 45.0 million boxes, the second largest crop ever produced. The new plantings were starting to be of productive age. The October FCOJ yield was estimated to be 1.29 gallons per box of oranges.

The hot and wet summer growing months were favorable for crop growth. However, October and early November were dry with irrigation systems in heavy use. By mid-November, heavy rains relieved the near-drought conditions, resulting in heavy fruit drop from blossom end splitting and a 6 million box reduction in the all orange forecast released in December. Five million of the six were Valencias, which were hurt most by splitting and one million was taken off the early-mid crop. Wet, cool weather was the story throughout most of December; however, the splitting abated and normal growth resumed. The first freeze threat of the season failed to materialize on December 28. There was some scattered frost that only burned a little new growth. There was no fruit damage. Near and slightly below freezing temperatures were recorded January 14 and 15, but no damage resulted because of the short duration of below freezing temperatures. Another freeze threat failed on the morning of January 30. There was only a little frost but no serious damage. Bloom buds began showing in February but were suppressed by the cool temperatures until mid-March. Peak bloom occurred the last week of March and the first week of April. Bloom was uniform on all types except tangerines which hardly seemed to bloom at all.

Harvest of the bumper orange crop lasted until early September when the last of the Valencias were picked. The total pickout was 169,700,000 boxes. The grapefruit total was 45,400,000 boxes. The final FCOJ yield for the 1972-73 year was 1.33176 gallons per box. This increase over the 1.29 October projection was attributed to the excellent weather throughout the harvest season. There was a record 132,210,060 boxes used to produce the record 176,073,382 gallons of frozen concentrated orange juice.

California's citrus trees and new crop fruit were both in excellent condition at the beginning of the 1972-73 season. Crop conditions remained generally excellent through the first week of December. The crop was projected at 27 million boxes of early and 25 million boxes of late oranges. Then, Central California experienced one of the worst freezes in recent years on the nights of December 8 through 11. Many areas experienced temperatures below 26 degrees for 12 to 14 hours with highs only around 32 degrees. Cullage from the December freezes was very heavy, especially in the San Joaquin Valley. Increased volume was diverted to processing plants which processed 17.0 million boxes of oranges, the second largest number of boxes ever processed. Total orange harvest for the year was only 18.7 million boxes of early oranges. Valencia oranges totaled 22.9 million boxes for the season.

Arizona's groves were in good condition at the beginning of the 1972-73 season. The overall projections were up from the preceding year. Orange production was forecast at 5.0 million boxes in October, very near the 5,060,000 boxes harvested by the end of the season. There was no adverse weather until mid-January. Only slight damage was reported to the crop with the damaged fruit going into processing. Peak bloom occurred by the first of April with prospects excellent for the 1972-73 crop.

Texas' tree condition at the start of the 1972-73 season was also excellent. Fruit set was regarded as good to excellent in most groves. Rains received in August and September had provided generous moisture, promoting good fruit sizes. Good soil moisture levels helped prevent freeze damage on January 10th and 11th. There was no fruit damage and very little or no tree damage. Excessive rains during February greatly helped the upcoming bloom period. Peak bloom was reached in mid-March.

AERIAL PHOTOGRAPHY

The Florida Crop and Livestock Reporting Service first began indexing the State's commercial citrus groves on aerial photography in December, 1965. Ground crews in 4-wheel drive vehicles identified all the State's groves by year in which set, fruit type and row spacings. Photo-interpreters in the Orlando office then delineated the groves by variety blocks on positive photo transparencies and measured them with planimeters to obtain acreages. Variety blocks were indexed by land section.

Early in 1967, the State's first comprehensive citrus inventory was completed. The survey indicated that there were 66,441,000 commercial citrus trees on 858,082 net acres of land. In addition, the survey provided acreage and number of trees by county, variety and year set. But, of equal importance, the 1965 inventory survey was designed for quick and economical updating. Since that time, the production area has been resurveyed each second winter - 1967, 1969 and 1971 - to determine changes.

The same three-mile wide flight lines established in 1965 are photographed on each succeeding flight. Approximately 13,000 square miles of photography is obtained at a 1 to 30,000 scale.

Photographing begins in November when weather conditions are most favorable and is generally completed in 60 to 90 days. The contractor delivers 9 X 9 inch contact prints from which the photo-interpreting is conducted to determine changes in groves. Following ground inspection, groves are delineated on enlargements at a scale of 1 inch to 660 feet.

COUNTY PRODUCTION

Estimates of production by fruit types and counties published by the Crop Reporting Service are based on objective survey data. Fruit numbers per tree from the limb count survey conducted in July, August and early September, adjusted for drop prior to harvest and to size data at maturity, are expanded by tree numbers to determine county figures.

These estimates are calculated at the request of the citrus industry for planning purposes. They are based on sample data and estimates, particularly in smaller counties, and may vary greatly.

SUMMARY OF ON-TREE PRICES AND VALUE OF SALES

1972-73 PRELIMINARY CITRUS ON-TREE PRICES

Even though there was a sharp increase in the volume of Florida citrus during the 1972-73 season, preliminary prices indicate a 12 percent decline in on-tree value of all citrus sales from the previous season. Lower values are evident in all fruit types except limes and lemons, which showed increases. The \$376,095,000 value for the 1972-73 season was, however, the second largest on-tree value of sales ever for a Florida citrus crop. Only the 1971-72 crop value was higher at \$427,245,000.

Preliminary on-tree value of oranges for 1972-73 was \$243,149,000, compared to \$280,317,000 for the previous season. The average price growers received for oranges during the 1972-73 season was \$1.43 per box, down sharply from the \$2.04 received the previous season. Early and mid-season fruit sold for \$1.30 a box on-tree and Valencias brought \$1.58 a box.

Value of production of grapefruit during the 1972-73 season at \$98,865,000 was down 10 percent from the 1971-72 season, but part of the decline in value was due to a reduction in volume. The average on-tree price for all grapefruit during the season was \$2.18 a box, down just moderately from \$2.32 received the previous season. This was the fourth straight season that on-tree prices of grapefruit was higher than for round oranges.

Value for specialty fruit in the 1972-73 season declined from the level established the previous season. However, reduced production contributed to much of the decline. Steady increases in production and on-tree prices for both limes and lemons have maintained a gradual increase in value of production for acid fruit.

1971-72 FINAL CITRUS PRICES

After all processed products were sold and a final value established for the 1971-72 season, a decline from the preliminary of only one percent to \$427,245,000 was registered in total on-tree value. All the reduction came in oranges which, no doubt, were adversely affected by the record size crop and the carryover on hand at the beginning of the season.

Final processed on-tree value per box for oranges was \$2.01 after all cooperative and market participation groups were paid. The preliminary on-tree price of oranges for processing was originally established at \$2.08 for fruit sold on spot and cash basis at the plants. In 1971-72, that volume was only 23 percent of the total fruit processed. Slightly higher picking costs than originally anticipated accounted for part of the price drop.

VALUE

Florida, All Citrus: Value of Sales, On-Tree, Crop Years 1963-64 through 1972-73

Year	Value	Year	Value
1963-64	\$ 337,087,000	1968-69	\$ 286,769,000
1964-65	274,476,000	1969-70	244,676,000
1965-66	225,408,000	1970-71	315,882,000
1966-67	178,075,000	1971-72 ^{1/}	427,245,000
1967-68	308,876,000	1972-73 ^{2/}	376,095,000

^{1/} Revised. ^{2/} Preliminary.

OFFICIAL CITRUS PRICES

All on-tree prices reported by the U. S. Department of Agriculture's Statistical Reporting Service and the Florida Crop and Livestock Reporting Service represent the average price received by growers for their fruit by types. Prices are based on records of commercial fresh fruit and processed fruit returns. The term "on-tree" relates to fruit value before it is picked and hauled from the grove.

Beginning with the first month in each season that three percent of a fruit type is harvested, the Florida Crop and Livestock Reporting Service calculates an average mid-month price. Fresh fruit sales organizations provide the average F. O. B. price and processors supply an average spot and cash price for fruit delivered to plants. From these values, an estimated charge for picking, hauling and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales for each month. At the end of the season, monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price.

A year later, after most processed products are sold, a survey of cooperatives and firms with market participation plans is conducted to establish a value for fruit previously classed as non-priced fruit. These prices, combined with spot and cash prices collected earlier, are weighted together to determine the final process price received by growers for various varieties of citrus. Charges for picking, hauling and packing, as determined by University of Florida economists, are deducted from the weighted average of prices obtained from all segments of the citrus industry to arrive at the final on-tree price received by producers.

FOREIGN EXPORT

Export of fresh Florida citrus to countries other than Canada and Mexico continues to increase at a rapid rate. Grapefruit dominate total fruit shipments with 2,331,000 standard box equivalents exported during the 1972-73 season.

The lifting of import restrictions by Japan during the 1971-72 season is the principal reason for this increase. An extensive advertising campaign by the Florida Citrus industry accounts for much of the grapefruit's popularity.

* * * * *

The net contents of a box of fruit varies between types of fruit and between States. The citrus code defines weight of a standard box of fruit in Florida. The table below shows net weight of these various boxes as recognized by the United States Department of Agriculture and those States involved.

Citrus Box Weights: Approximate Net Weight in Pounds by Fruit Type and States

States	Oranges and others ^{1/}	Grapefruit	Tangerines	Lemons	Limes
Florida	90	85	95	90	80
California	75	65	75	76	--
Texas	90	80	--	--	--
Arizona	75	64	75	76	--

^{1/} Includes Florida Temples, Tangelos and Murcotts at 90 lbs.

Table 1 -- Florida Citrus: Production of All Citrus Since 1886-87

Crop Year	TYPE OF FRUIT				Crop Year	TYPE OF FRUIT

HISTORY OF FLORIDA'S CITRUS INDUSTRY

The citrus tree is a native of the Orient. From this area it was carried ever westward by man, to India, to the Mediterranean and on across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Haiti. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were growing in abundance around St. Augustine at that time. Early settlers in Florida some two centuries later found wild citrus trees scattered over the State. One of the oldest cultivated groves planted in Florida (Hume, 1926, p. 95) is thought to be the Don Phillippe grove in Pinellas County, planted some time between 1809 and 1820. Several of the original trees still remain. It is believed that Duncan Grapefruit originated from these trees. The site is now Don Phillippe Park just north of Safety Harbor.

Citrus production in Florida had reached the all time high to more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. Since that time the volume steadily increased and by the mid-forties Florida was producing more than half the nations citrus fruit supply. Florida surpassed all other States in bearing citrus acreage in 1932-33 with 265,400 acres, which accounted for 46 percent of the United States total bearing acreage. As the decade of the seventies began Florida's dominance of the nations citrus became even more apparent. In 1972-73 the state had 68.0 percent of the nations bearing acreage and 76.0 percent of the production.
