Agricultural Marketing Service and
Statistical Reporting Service

ACKNOWLEDGEMENTS

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida are official State and USDA estimates prepared by the Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA Statistical Reporting Service. Shipment and market price data are from the Bureau of Market News and USDA's Agricultural Marketing Service. Canned and frozen pack statistics were compiled by the Florida Cannery Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetable Inspection, Florida Department of Agriculture and Consumer Services were employed in production and utilization estimates. The Growers Administrative Committee assisted in assembling these data.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The report was assembled under the direction of Paul E. Shuler and Robert R. Terry of the Florida Crop and Livestock Reporting Service, and E. F. Scarborough, Bureau of Market News.

Central Florida

This year's weather was not as favorable to agriculturists as last season's. Although this year was not unusually cold, the wide month-to-month temperature variations and general lack of precipitation resulted in less than ideal growing conditions. Citrus trees were not able to reach their desirable semi-dormancy state, due to the temperature variations. Frost and freezing temperatures injured or killed much of the new growth in unprotected groves. The coldest periods again required the use of cold protection devices in unfavorable locations. Deficient rainfall continued to be a problem through the late Spring period.

NOVEMBER: The season opened with mild weather which continued through the first two weeks of the month. Near the middle of November, a cold front dropped temperatures, with most minima in the 40's. Temperatures again moderated with minimums remaining in the 50's and 60's. Near the end of the month another cold front brought temperatures down into the 30's with no significant frost. Only a few locations reported below-freezing temperatures. Rainfall was below normal for the month with amounts in the Tampa Bay area generally 1 to 3 inches. Elsewhere, totals were nearer 1/2 to 1-1/2 inches. Most of the rainfall occurred on the first day of November, and near the middle and end of the month, with the passage of several cold fronts.

DECEMBER: Throughout Central Florida temperatures were below normal. A series of cold fronts moved through the state resulting in alternating periods of moderate temperatures followed by several days of cold temperatures. The last of November cold spell carried over into the first part of December, with some temperatures in the Orlando District dropping into the 30's on the 2nd. A gradual warming trend followed, with minima the following week in the 40's and 50's. On the 8th, another cold front passed through the area bringing the first widespread frost and freezing temperatures. Temperatures during the remainder of the month fluctuated as more cold waves and warming periods occurred.

JANUARY: Record-breaking warm weather in many locations characterized much of the month. Afternoon highs were usually in the 70's, and frequently in the low 80's. Minimum temperatures were mostly in the 50's and 60's. Precipitation totals were well below normal. The combination of deficient moisture, and the new growth prompted by the warm weather, left the citrus trees in a vulnerable position for February.

FEBRUARY: Warm weather continued until the 5th of February when a cold front passed through the state. Throughout the month, several cold fronts passed through, causing intermittent periods of cold and mild temperatures. Rainfall for the month was slightly less than normal with many locations receiving between 1 to 2 inches. Some locations in the northwestern section reported more than 3 inches.

MARCH: Above-normal temperatures continued during most of the month, with only two brief cold spells. High readings were mainly in the upper 70's. Minima temperatures fell mostly in the 50's and low 60's throughout the month. Rainfall was near normal, with most locations receiving 2 to 3 inches, except in the southern portion, where less than 1 inch was reported.

South Florida

The first general frost and freeze in South Florida since the 1970-71 season occurred this season. Generally, however, temperatures were above normal with seasonal rainfall amounts averaging 6 to 8 inches below normal in most areas. There were only 15 "cold nights," when temperatures reached 36 degrees or lower. Frost was reported on six nights during the period November through March. The lowest reported temperature was 27 degrees, which occurred in the Indian River District on December 28. This caused the heaviest damage to agricultural products throughout the South Florida area. Along the East Coast farming areas, strong winds probably caused more damage than the patchy frost.

NOVEMBER: November's weather continued to promote good growth and maturity of most vegetable crops and sugar cane. However, the hardy salad vegetables around Lake Okeechobee were adversely affected by the combination of strong winds, warm temperatures, and heavy dew. Daily maximum temperatures were mostly in the low to high 80's, except for the last two days of the month, when temperatures were in the mid-60's to the 70's.

DECEMBER: The coldest month of the season. Mild weather continued until the 9th when the first intrusion of cold air occurred. On the morning of the 12th, for the first time since 1971, general frost and freezing temperatures were experienced in most all areas of South Florida. Rains were well spaced during the month, and provided adequate moisture in most areas. Irrigation was necessary, however, in most citrus groves during the first part of the month.

JANUARY: January was the warmest and wettest month on record in several localities. Fort Myers this season was the second warmest since 1891, which was only exceeded in 1937. The minima temperatures ranged from the mid-50's and 60's in the interior, to the 60's and 70's along the coastal areas. The warm weather caused rapid growth of all vegetables, thus causing some vegetables to mature too soon and lowered the quality. Heavy rains on the 14th, of 10 to 12 inches, caused some fields in the Pompano area to be replanted. Only minor crop damage was reported in the farming areas of eastern Palm Beach County.

FEBRUARY: The second coldest month of the season. The warm weather continued until the 9th, when a cold front lowered temperatures in almost all districts. Scattered frost was reported as far south as Homestead. During the remainder of the month several other cold fronts moved through the south Florida area. Hundreds of acres of young corn was killed or damaged and had to be replanted. Young sugar cane suffered extensive damage in the colder areas. Some areas of South Florida received no rain. Rainfall for the month averaged 1 to 2 inches below normal.

MARCH: Warm and dry weather returned in March. The only cold night reported for the month was on the 18th, in the Kissimmee Valley District. Maximum temperatures ranged from the upper 70's to the mid-80's along the coastal sections, while the interior areas ranged from the mid-80's to the low 90's. Rainfall was again light with some areas reporting no rainfall. Weather conditions were favorable for the spring vegetable crops.

1973-74 PRODUCTION SUMMARY

Florida's 1973-74 season began in mid-February with pin head bloom beginning to form in most areas. Below normal average temperatures in February held the bloom at this level until mid-March when warmer weather prompted open, full bloom. Excellent soil moisture and numerous spring showers promoted a heavy fruit set.

The initial forecast of production issued October 12, 1973 was for 160 million boxes of round oranges, only slightly less than the previous season's record harvest. Grapefruit production was estimated at 48 million boxes, an all-time high. The FCOJ yield projection was for 1.28 gallons.

The State's citrus trees remained in excellent condition throughout the summer and into the harvest season. Harvest of grapefruit began on a very limited scale in early September. Rainfall was generally above normal levels in September with some low areas experiencing standing water. October brought cooler, drier weather leading to natural color break on Hamlin oranges and K-Earlys. Harvest of oranges and specialty fruit began increasing in November. December brought dry weather early in the month and light showers later in the month. Colder nights with freezing temperatures and frost in some locations occurred on several mornings. Minimal leaf burn was the only damage observed. The December forecast of production remained unchanged.

January brought unseasonably warm weather. Temperatures ranged 13 degrees above normal averages in some areas. Rainfall was adequate but not plentiful. Freezing or near freezing temperatures occurred on the mornings of the 26th and 27th of February, but damage was confined mostly to foliage.

Drier weather occurred in early March with most growers irrigating heavily. Some older groves that were not irrigated did not bloom until rains in late March forced flush.

Harvesting patterns during the season were considered near normal with an adequate supply of labor.

Total pickout was 165.8 million boxes of round oranges and a record 48.1 million boxes of grapefruit. The pack of FCOJ totaled 171.8 million gallons from 132.5 million boxes of oranges. The final FCOJ yield was 1.29725 gallons per box.

California's citrus trees and new crop were in excellent condition and remained in good condition throughout the season despite cold weather during the nights of January 2 and 3. The crop was forecast at 20 million boxes of Navel and early varieties and 16 million boxes of Valencia oranges. This was a slight increase for early and Navel varieties. The sizeable decrease for Valencias from the previous season's production was a result of cold weather the previous winter. Harvest progressed normally. Early and Navel production was 21.9 million boxes and Valencia production was 18.8 million boxes.

Arizona's crop and trees were in generally good condition throughout the crop year. Production was forecast at 750,000 boxes of early and Navel varieties and 3.8 million boxes of Valencias. Final production totaled 450,000 boxes of early and Navel varieties and 2,960,000 boxes of Valencias. This was down substantially from the previous season's production, reflecting cold damage from the pre-

vious winter. Grapefruit production was also less than the previous season.

Texas began harvest of early varieties of oranges in September and grapefruit in October. The crop was forecast at 5.4 million boxes of early and Navel varieties and 2.6 million boxes of Valencias, both up slightly from the previous season. A hard freeze hit the lower Rio Grande Valley area on December 20. Temperatures were below 26 degrees for 8 hours in some areas. Leaf burn was moderate to severe, and some tree damage was reported. Some increased fruit droppage resulted. Harvest was complete at 4.2 million boxes of Navel and early varieties and 2.4 million boxes of Valencias.

AERIAL PHOTOGRAPHY

The Florida Crop and Livestock Reporting Service first began indexing the State's commercial citrus groves on aerial photography in December, 1965. Ground crews in 4-wheel drive vehicles identified all the State's groves by year in which set, fruit type and row spacings. Photo-interpretors in the Orlando office then delineated the groves by variety blocks on positive photo transparencies at a scale of 1 inch to 660 feet. Variety blocks were measured with planimeters to obtain acreages and indexed by land section.

The 1965 survey indicated that there were 66,441,000 commercial citrus trees on 858,082 net acres of land. In addition, the survey provided acreage and number of trees by county, variety and year set. But, of equal importance, the inventory survey was designed for quick and economical updating. Since that time, the production area has been resurveyed each second winter - 1967, 1969, 1971 and 1973 - to determine changes.

Photographing begins in November when weather conditions are most favorable and is generally completed in 60 to 90 days. The same three-mile wide flight lines established in 1965 are photographed on each succeeding flight. Approximately 13,000 square miles of photography is obtained at a 1 to 30,000 scale.

The latest survey shows there were 864,098 acres of commercial citrus, as of the end of 1973. This is a net decline of 1.6 percent from the 878,019 acres in 1971. The new survey shows a removal of 40,200 acres between the surveys, more than offsetting the 26,260 acres of new trees, set in 1972 and 1973.

Significant net acreage gains were registered in only a few counties, the principal ones being DeSoto and Hendry. Most citrus types reflect a slight reduction. However, in seedless grapefruit varieties, there was a gain in acreage, primarily along the Lower East Coast.

There are approximately 1,200 enlargements on file. These enlargements are replaced over a four-year period, approximately 600 after each flight year and information from the old enlargements is transferred by hand to the new enlargements.

Between surveys, research will be conducted into better methods of enumerating and reporting changes that are occurring within commercial groves. Particular emphasis will be placed on the method of counting vacancies and resets below the 10 percent vacancy rule currently in effect.

1973-74 VALUE OF SALES AND ON-TREE PRICES

VALUE

The on-tree value of all Florida citrus declined for the second season in a row. The \$373,543,000 preliminary value is 5 percent below last year's value and 13 percent below the record \$427,245,000 received during the 1971-72 season. Lower returns per box were recorded for grapefruit, temples, tangelos, and honey tangerines. Returns per box for oranges were the same as last season while tangerines, limes and lemons recorded an increase.

While returns per box for all oranges remained the same as last season at \$1.56 per box, considerable change is noted in returns for fresh usage. Average returns per box for fresh usage increased from \$1.85 last season to \$2.27 this season. Total fresh volume, however, reached the lowest level in recent history, accounting for only 7 percent of total utilization. Average returns per box for processing were only 3 cents less than last season, with just under 3 million fewer boxes used. Total value declined 2 percent.

A record high volume of grapefruit was shipped fresh this season. Average returns were less at \$2.82 this season as compared to \$3.14 and \$3.10 for the previous two seasons. Total grapefruit value was down 14 percent on the 6 percent larger, record crop. For the fifth consecutive season, grapefruit returns per box were greater than for oranges.

Total value of the temple crop declined to the lowest level since 1966-67. Price received per box was also the lowest since that season. Value of tangelos was lower, too, reflecting the second lowest price per box in recent history. Price per box for tangerines was the highest since 1967-68 but close to the 1971-72 season. Total value, however, was less than both seasons. The highest value to date was recorded for Murcott honey tangerines although price per box was lower than last season.

Florida, All Citrus: Value of Sales, On-Tree, Crop Years 1964-65 through 1973-74

| Crop Year | Value | Crop Year | Value |
|-----------|---------------|------------|---------------|
| 1964-65 | \$274,476,000 | 1969-70 | \$244,676,000 |
| 1965-66 | 225,408,000 | 1970-71 | 315,882,000 |
| 1966-67 | 178,075,000 | 1971-72 | 427,245,000 |
| 1967-68 | 308,876,000 | 1972-73 1/ | 394,645,000 |
| 1968-69 | 286,769,000 | 1973-74 2/ | 373,543,000 |

1/ Revised. 2/ Preliminary.

COUNTY PRODUCTION

Estimates of production by fruit type and county published by the Crop Reporting Service are based on objective survey data. Fruit numbers per tree from the limb count survey conducted in late July, August and early September, adjusted for droppage, projected to harvest and projected size at harvest are expanded by tree numbers.

These estimates are calculated at the request of the citrus industry for planning purposes. They are based on production area sample data and estimates, and may vary greatly.

PRICES

All on-tree prices reported by the U. S. Department of Agriculture's Statistical Reporting Service and the Florida Crop and Livestock Reporting Service represent the average price received by growers for their fruit by types. Prices are based on records of commercial fresh fruit and processed fruit returns. The term "on-tree" relates to fruit value before it is picked and hauled from the grove.

Each season beginning with the first month that three percent of a fruit type is harvested, the Florida Crop and Livestock Reporting Service calculates an average mid-month price. Fresh fruit sales organizations provide the average F. O. B. price and processors supply an average spot and cash price for fruit delivered to plants. From these values, an estimated charge for picking, hauling and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales for each month. At the end of the season, monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price.

A year later, after most processed products are sold, a survey of cooperatives and firms with market participation plans is conducted to establish a value of fruit previously classed as non-priced fruit. These prices, combined with spot and cash prices collected earlier, are weighted together to determine the final process price received by growers for various varieties of citrus. Charges for picking, hauling and packing, as determined by University of Florida economists, are deducted from the weighted average of prices obtained from all segments of the citrus industry to arrive at the final on-tree price received by producers.

FOREIGN EXPORT

Exports of fresh Florida citrus to countries other than Canada and Mexico continue to increase at a rapid rate. Grapefruit remains dominant in total fruit shipments with 3,996,000 standard box equivalents exported during the 1973-74 season. This represents a 71 percent increase from last year. Orange shipments have increased from 197,000 boxes in 1972-73 to 423,000 this year, or a 115 percent increase.

The major reasons cited for the increased shipments are increased world demand and less import restrictions from importing nations. Wider distribution of grapefruit outside of the Tokyo area, contributed greatly to increase of exports to Japan in the 1973-74 season.

Citrus Box Weights: Approximate Net Weight in Pounds by Fruit Type and States

| States | Oranges and others 1/ | Grapefruit | Tangerines | Lemons | Limes |
|------------|-----------------------|------------|------------|--------|-------|
| Florida | 90 | 85 | 95 | 90 | 80 |
| California | 75 | 65 | 75 | 76 | -- |
| Texas | 85 | 80 | -- | -- | -- |
| Arizona | 75 | 64 | 75 | 76 | -- |

1/ Includes Florida Temples, Tangelos and Honey Tangerines at 90 lbs.

Table 1 -- Florida Citrus: Production of All Citrus Since 1886-87

HISTORY OF FLORIDA'S CITRUS INDUSTRY

The citrus tree is a native of the Orient. From this area it was carried ever westward by man, to India, to the Mediterranean and on across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Haiti. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were growing in abundance around St. Augustine at that time. Early settlers in Florida some two centuries later found wild citrus trees scattered over the State. One of the oldest cultivated groves planted in Florida (Hume, 1926, p. 95) is thought to be the Don Phillippe grove in Pinellas County, planted some time between 1809 and 1820. Several of the original trees still remain. It is believed that Duncan Grapefruit originated from these trees. The site is now Don Phillippe Park just north of Safety Harbor.

Citrus production in Florida had reached an all time high of more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. Since that time the volume steadily increased and by the mid-forties Florida was producing more than half the Nation's citrus fruit supply. Florida surpassed all other States in bearing citrus acreage in 1932-33 with 265,000 acres, which accounted for 46 percent of the United States total bearing acreage. As the decade of the seventies began Florida's dominance of the Nation's citrus became even more apparent. In 1973-74 Florida had 75.3 percent of the Nation's production.
