Agricultural Marketing Service and  
Statistical Reporting Service

### **Acknowledgment**

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida are official estimates of the Florida Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA Statistical Reporting Service. Shipment and market price data are from the Bureau of Market News and USDA's Agricultural Marketing Service. Canned and frozen pack statistics were compiled by the Florida Cannery Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetable Inspection, Florida Department of Agriculture and Consumer Services, were employed in production and utilization estimates. The Growers Administrative Committee assisted in assembling these data.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The report was assembled under the direction of Paul E. Shuler and Robert R. Terry of the Florida Crop and Livestock Reporting Service, and E. F. Scarborough, Bureau of Market News.

FLORIDA WEATHER HIGHLIGHTS, SELECTED AREAS AND MONTHS, 1976-77 CROP YEAR

CENTRAL FLORIDA

Record low temperatures were reported during the 1976-77 season. Lowest readings of the period accompanied by snowfall occurred the week of January 18-22. Temperatures were severe enough to cause loss of fruit and juice, so that juice yields were substantially reduced. A succession of cold fronts that began moving into the state in October resulted in below normal temperatures for several months prior to the freeze. These low temperatures resulted in complete tree dormancy and the January freeze did very little tree or wood damage. Below average readings were reported for the months of December, January and February. The cold weather pattern continued into the first two days of March, then an abrupt shift to above normal temperatures occurred until the end of the season.

NOVEMBER: Frontal activity started early in the season. During the last half of October temperatures dropped into the 40's on several nights. On the morning of November 6th, 30's were recorded in colder locations. On the 9th and again on the 23rd, 24th and 25th there were minimums in the upper 20's and 30's with scattered frost. Another cold front swept through the state on November 30th. Rainfall for the month averaged 1-1/2 to 3 inches.

DECEMBER: The first half of the month was characterized by unusually cloudy weather. Coldest minimums during this period occurred on the 9th and ranged mostly in the 30's. A colder weather pattern became established in the last half of the month. Eight of the last 15 days of the month had lows in the 30's and low 40's. Rainfall for the month was again above normal, ranging from 2 to 4 inches.

JANUARY: This was the coldest month ever recorded in central Florida. It averaged 8 to 10 degrees below normal. Lakeland had its first measurable snowfall since records began in 1915. The period of January 16th through 20th was the coldest of the month with temperatures ranging from the low to upper 20's over the area for long durations the morning of the 18th to 20th. Durations of 9 to 13 hours below 28 degrees were common on the 20th, the coldest morning. Two to three inches of rain fell over most of central Florida in January.

FEBRUARY: Fronts continued to pass regularly through the state in February, bringing another cold month to the Peninsula. There were a number of days when minimum morning temperatures were in the 30's with three mornings when readings were in the 20's in some locations. Rainfall in February was a little below normal with most locations reporting between 1 to 2-1/2 inches.

MARCH: Minimum temperatures on March 1 and 2 were mainly in the 30's with only isolated locations dropping into the upper 20's. After that, minimum temperatures rapidly moderated into the 50's and 60's. By midmonth, afternoon highs were well into the 80's. The last cold front of the season moved in on the 22nd and extended through the 24th. Rainfall for the month averaged from less than 1 inch to in excess of 1-1/2 inches.

SOUTH FLORIDA

The 1976-77 season was marked by unusually cold weather. November opened with below normal temperatures over most of south Florida and except for brief warm spells the weather continued cold until the first of March. The coldest weather occurred during January when record low temperatures were recorded during the night and morning of the 19th and 20th. On the morning of the 20th, lows were mostly in the low to mid 20's with unofficial readings of 16 degrees as far south as the Homestead area. In all, 15 cold nights occurred in January over south Florida with freezing temperatures on 10 of these nights. The continued cold weather following the freeze permitted growers to salvage part of the freeze damaged crops, especially in the citrus industry.

NOVEMBER: Temperatures averaged below normal for the month with cold nights (36 degrees or less) reported in south Florida on the 8th, 23rd and 25th. No freezing temperatures were reported during the month. Rainfall was near normal.

DECEMBER: Weather conditions were variable, with temperatures ranging from below normal to near normal. Cold nights in south Florida occurred on the 18th, 22nd, 27th, 28th and 30th. Temperatures of 32 degrees or lower occurred on the 22nd, 28th and 30th. Rainfall for the month was near normal.

JANUARY: Cold nights in south Florida were recorded on the 8th, 11th, 12th, 17-24th, 26th, 27th, 30th and 31st. Freezing or lower occurred on the 11th, 17th through the 23rd, 26th and 30th. Snow flurries were recorded on the morning of the 19th, a "first" for many areas. After the 20th, harvesting of crops was accelerated with continued cold temperatures aiding in salvage operations in cold damaged crops. Rainfall on the lower East Coast area was one-half inch below normal for the month with the rest of the southern portion near normal.

FEBRUARY: The weather was generally cold with freezing or lower on the 1st, 17th, 18th, 21st and 22nd. Cold nights were recorded on February 1st, 6th, 7th, 17th, 18th, 21st, 22nd and 25th. Citrus trees of all ages began sprouting feather-like new growth. Rainfall was below normal and citrus groves were irrigated.

MARCH: The month opened with cold nights the first two days, and temperatures of 32 degrees and lower were reported on the 2nd. The remainder of March was mild to warm, and averaged at or above normal. Citrus groves were irrigated regularly.

## 1976-77 PRODUCTION SUMMARY

Florida's 1976-77 season began with the first stages of bloom development in late February. Peak open bloom occurred about mid-March. February and March were relatively dry months, but relatively heavy rains in April and May alleviated the near drought conditions.

Rainfall continued excellent all summer and into the fall months. Temperatures averaged up to 10 degrees below normal in October, November and most of December. These weather conditions induced almost total dormancy and proved to be the factor that saved many citrus trees from the freezing conditions of January 18-20.

The initial forecast, in October, indicated a record 209 million boxes of round oranges, and increased to 213 million in January. Grapefruit was forecast at a record 58.0 million boxes.

Temperatures over the entire citrus growing area of the state were below freezing on at least three, and in some areas four mornings the week of January 16-21. Icing was observed in all fruit, including grapefruit on the East Coast. Temperatures continued to average below normal throughout January and most of February.

Harvest increased rapidly following the week of damaging cold in an effort to salvage as much of the early and mid-season crop as possible. Of the 121 million boxes forecast on January 1, 115 million boxes were eventually harvested. The FCOJ yield was reduced from the forecast of 1.24 gallons to a final of 1.08 gallons per box.

Valencias were not mature at the time of the freeze and more box and juice loss occurred. The January 1 forecast of 92 million boxes was reduced 22 percent to 71.8 million boxes finally harvested. The juice yield amounted to 1.05 gallons of FCOJ per box compared to the prefreeze forecast of 1.36. This was a 23 percent reduction.

Total production of grapefruit was 51.5 million boxes with loss from the freeze amounting to about 11 percent. Fresh shipments were down nearly 20 percent as freeze damaged fruit was diverted to processing.

Despite the heavy losses from the freeze, total boxes harvested was a record high for both oranges and grapefruit. Final pack of FCOJ however, was down 15 percent from the previous season's 186,265,000 gallons to 158,035,000 gallons. Pre-freeze estimates had placed the total FCOJ availability at about 230 million gallons.

California's fresh fruit season began with shipments of Navels in late October. Higher than normal winds caused some fruit scarring. Intermittent rainfall throughout the winter season helped, but most growers irrigated often. Water supplies became severely depleted in some areas by late spring.

The initial forecast of 52 million boxes of oranges was not realized and the 46.6 million box output was the lowest since 1973-74. Grapefruit production continued to trend upward, with 7.6 million boxes harvested--a record high crop.

Arizona's harvest of grapefruit and mandarin types began in early November with good quality fruit shipped fresh. Adequate moisture levels were maintained and a normal size crop of 3.95 million boxes of oranges and 3 million boxes of grapefruit were harvested.

Texas began harvest of grapefruit and early orange varieties in mid-October. Heavy rains hampered maturity and slowed harvest in November. An unusually wet and cool winter

was experienced, but no freeze damage was reported from the passage of several cold fronts. The orange crop was 6.9 million boxes, the highest since 1972-73. Grapefruit harvest was a record 12.4 million boxes.

### Tree Census

The Florida Crop and Livestock Reporting Service first began indexing the state's commercial citrus groves on aerial photography in December 1965. Ground crews in 4-wheel drive vehicles identified all the state's groves by year in which set, fruit type, and row spacing. Photo interpreters in the Orlando office then delineated the groves by variety blocks on positive photo transparencies at a scale of 1 inch to 660 feet. Variety blocks were measured with planimeters to obtain acreage and then indexed by land section.

The 1965 survey indicated there were 66,441,000 commercial citrus trees on 858,082 net acres of land. In addition, the survey provided acreage and number of trees by county, variety and year set. But, of equal importance, the inventory was designed for quick and economical updating. Since that time, the production area has been resurveyed each second winter--1967, 1969, 1971, 1973 and 1975--to determine changes.

Photographing begins in November when weather conditions are most favorable and is generally completed in 80 to 90 days. The same three-mile-wide flight lines established in 1965 are photographed on each succeeding flight. Approximately 13,500 square miles of photography is obtained at a 1 to 30,000 scale.

The latest survey shows there were 852,369 acres of commercial citrus as of January 1976. This is a net decline of 1.4 percent from the 864,098 acres in December 1973. The removal of 40,518 acres from commercial production during 1974 and 1975 more than offset the 28,789 acres of trees planted. Acreage gains were recorded in only a few counties, the principal ones being Hendry, Indian River and St. Lucie. All types of citrus showed net declines except seedless grapefruit.

In addition to enumerating total changes in grove acreage, the surveys in 1973 and 1975 were designed to give more detail on acreage removals and additions. The results of this survey showed that one half of the acreage set in the calendar years 1974 and 1975 was reset plantings. Also, 25 percent of the new acreage was planted on land that had never before been used for citrus. Of the acreage that was removed from commercial production, approximately 12.5 percent was taken out for commercial development. The comparable figures for the years 1972 and 1973 showed that one third of the new acreage was reset plantings, and slightly more than 25 percent of the acreage removed was for commercial reasons.

The current survey also showed that most of the new acreage was located in the East Coast and Lower Interior areas of the state. Two thirds of the loss due to commercial development occurred in the Lower Interior and West Coast. The East Coast was the only area of the state showing a net gain.

There are approximately 1,200 photography enlargements on file. These are replaced over a four-year period, approximately 600 after each flight year. Information from the old enlargements is transferred manually to the new enlargements. Work on the seventh biennial tree census began in November 1977.

1976-77 VALUE OF SALES, PRICES AND EXPORTS

VALUE

The preliminary estimate of 1976-77 season on-tree value of all Florida citrus is \$366,446,000, which is a 17 percent decrease from the revised estimate of \$440,326,000 for the 1975-76 season. The preliminary estimates of price and value are based only on that part of production which was priced at time of harvest--in recent years this has been about 20 percent of the volume of processed oranges.

Prices rose substantially after the January freeze but much of the cash sales of early and midseason oranges were made at lower pre-freeze prices. Returns from that part of the crops in participation pools are not finally known until the pools are closed in the following year, and these returns will undoubtedly reflect the higher prices for product which were received after the freeze. The final 1976-77 season revised prices will be released in September, 1978.

Preliminary grapefruit prices are only slightly lower than the previous season.

The delivered-in price for spot and cash fruit going into FCOJ in 1976-77 was \$.50 per pound of solids compared to the previous season's \$.53. The final price of all fruit going into FCOJ will undoubtedly be revised upward when all pool returns are finalized next year.

Florida, all citrus: Value of sales, on-tree, crop years 1967-68 through 1976-77

Crop year	Value	Crop year	Value
1967-68	\$308,876,000	1972-73	\$394,645,000
1968-69	286,769,000	1973-74	359,388,000
1969-70	244,676,000	1974-75	397,066,000
1970-71	315,882,000	1975-76 <sup>1/</sup>	440,326,000
1971-72	427,245,000	1976-77 <sup>2/</sup>	366,446,000

<sup>1/</sup>1975-76 and earlier years, revised. <sup>2/</sup>1976-77 preliminary.

COUNTY PRODUCTION

Estimates of production by fruit type and county published by the Crop Reporting Service are based on objective survey data. Fruit numbers per tree obtained from the limb count survey done July-September are adjusted for droppage to harvest time, combined with harvest size, and expanded by tree numbers.

These county estimates are calculated at the request of the citrus industry, from sample data obtained from the citrus crop estimates program. Since the sample is designed for estimates at the State-wide level, county samples are roughly proportionate to the amount of citrus--thus some samples are very small with the county estimates subject to large sampling variability.

PRICES

All on-tree prices reported by the U.S. Department of Agriculture's Statistical Reporting Service and the Florida Crop and Livestock Reporting Service represent the average price received by growers for their fruit by types. Prices are based on records of commercial fresh fruit and processed fruit returns. The term "on-tree" relates to fruit value before it is picked and hauled from the grove.

Each season, beginning with the first month that three

percent of a fruit type is harvested, the Florida Crop and Livestock Reporting Service estimates an average monthly price. Fresh fruit sales organizations provide the average F. O. B. price and processors supply an average spot and cash price for fruit delivered to plants. From these values, an estimated charge for picking, hauling and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales for each month. At the end of the season, monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price.

A year later, after most processed products are sold, a survey of cooperatives and firms with market participation plans is conducted to establish a value of fruit previously classed as non-processed fruit. These prices, combined with spot and cash prices collected earlier, are weighted together to determine the final process price received by growers for various varieties of citrus. Charges for picking, hauling and packing, as determined by University of Florida economists, are deducted from the weighted average of prices obtained from all segments of the citrus industry to arrive at the final on-tree price received by producers.

FOREIGN EXPORTS

Exports of Florida fresh grapefruit continued to expand in 1976-77 while volume of oranges and specialty fruits declined. Japan is the principal destination of grapefruit exported overseas, to countries other than Mexico and Canada, and accounted for 81 percent of the 4,259,000 boxes exported overseas. The Japanese market takes predominantly white seedless grapefruit in 32 to 40 sizes.

Most of the fresh orange exports are to European countries. The 1976-77 total of 186,000 boxes went primarily to Germany. Historically, these exports to the Continent have varied widely from year to year, with the volume related to crop sizes in the Mediterranean area. Opportunities for growth in both grapefruit and orange exports to Europe are favorable according to Florida shippers who are concentrating more sales activity in that market area.

Orange concentrate exports expanded 37 percent during July, 1976 through June, 1977 as compared to fiscal 1975-76, according to U. S. Bureau of Census records. Data are not available for exports by U. S. state of origin, however, it can be assumed that only minor amounts of reported exports are produced outside of Florida. During 1975-76, 13.2 million gallons of 45 degree Brix concentrate were exported with 58 percent going to Canada. During the 12 months ending June 30, 1977 a reported 18.1 million gallons were exported. Forty-six percent (8.3 million gallons) went to Canada.

Citrus box weights: Approximate net weight in pounds by fruit type and States

States	Oranges and others <sup>1/</sup>	Grapefruit	Tangerines	Lemons	Limes

History of Florida's Citrus Industry

The citrus tree is a native of the Orient. From this area it was carried ever westward by man, to India, to the Mediterranean and on across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Haiti. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were growing in abundance around St. Augustine at that time. Early settlers in Florida some two centuries later found wild citrus trees scattered over the state. One of the oldest cultivated groves planted in Florida (Hume, 1926 p. 95) is thought to be the Don Phillippe grove in Pinellas County, planted some time between 1809 and 1820.

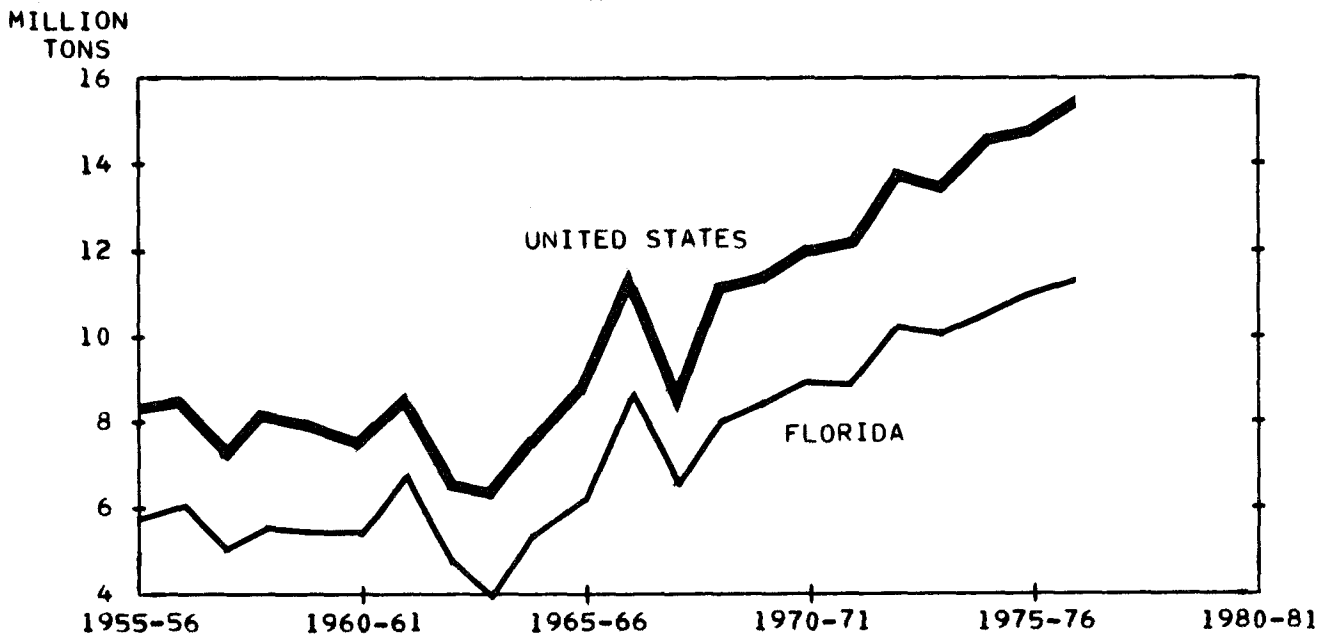

Citrus production in Florida had reached an all time high of more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. Since that time the volume steadily increased. As the decade of the seventies began Florida's dominance of the Nation's citrus became even more apparent. In 1976-77 Florida had 73.2 percent of the Nation's production.

Source: See page 49, data sources, item 5.

Footnote 1/ for pages 35 thru 37. Final Mexico import shipments to the U. S. are reported by FAS as a combined total for oranges and tangerines. The total shown on pages 35 thru 37 has been broken down proportionally into oranges and tangerines from Plant Quarantine data reported at the time of the crossing. Plant Quarantine releases gave separate totals for these two types of citrus. Mexican shipments excludes Canadian shipments.
