Acknowledgment

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida are official estimates of the Florida Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA Economics, Statistics, and Cooperatives Service. Canned and frozen pack statistics were compiled by the Florida Citrus Processors Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetable Inspection, Florida Department of Agriculture and Consumer Services, were employed in production and utilization estimates. The Citrus Administrative Committee assisted in assembling these data.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The report was assembled under the direction of James W. Todd and Robert R. Terry of the Florida Crop and Livestock Reporting Service.

FLORIDA WEATHER HIGHLIGHTS, SELECTED AREAS AND MONTHS, 1978-79 CROP YEAR

CENTRAL FLORIDA

The 1978-79 winter season was the warmest since 1974-75. Temperatures for the November through March period were characterized as near normal. November and December were relatively mild, however, a major shift occurred after the New Year with the months of January and February being below normal. March was cool. Rainfall for the season was above normal.

NOVEMBER: A cold front passed through the state near the end of October. A high pressure settled southward over the Peninsula, bringing temperatures in the 40's with a few of the coldest spots in the 30's on the 5th. Temperatures then warmed to normal or above the remainder of the month. Daytime highs were consistently in the upper 70's to mid 80's, while lows remained in the mid 50's to mid 60's. Rainfall was spotty and most areas received less than 1/2 inch of precipitation.

DECEMBER: The days continued mild until interrupted by the cold front of the 5th. Readings on the morning of the 6th dropped into the 40's, then a warming trend occurred. A stronger cold front passed through the Peninsula on the 10th and remained through the 16th. Lows were in the 40's. The coldest night of the month was on the 18th with temperatures ranging over the area from the 30's to low 40's. Another front moved through on the 25th, however a cloud cover kept readings in the 40's. Rainfall ranged from 3 to 4 inches over the interior to over 5 inches along the east coast.

JANUARY: An extremely vigorous cold front moved down the state on the 2nd. Lows on the 3rd were mostly in the mid to upper 20's—a drop of 50 degrees from the previous day's high. Durations of below 28 degrees lasted for a few hours. On the 4th there was a wider variation of temperatures with only the coldest locations reaching the mid 20's. Frost was widespread. Fronts continued to pass regularly through the state the remainder of the month. The mornings of the 15th and 29th, short durations of below freezing were reported. Rainfall was more than 6 inches at most locations and some in excess of 7 inches. Almost half of the days had some measurable precipitation.

FEBRUARY: No extremely low readings were reported during the month. On the 1st and 2nd, temperatures dipped to the freezing mark. From the 9th to the 15th, morning lows dropped into the 30's. Again on the mornings of the 27th and 28th, temperatures were in the 30's. Rain occurred at the beginning and end of the month with most amounts ranging from 1 to 2 inches.

MARCH: Several cold fronts passed through the state during the month but they were weaker and farther apart than in January and February. Temperatures were in the 40's on the 9th, 10th, 12th and 14th with a few cold spots in the upper 30's. After the 15th the weather warmed to near normal for two weeks, with mild days and cool nights. A strong cold front on the 24th dropped readings into the mid and upper 30's on the 26th and 27th. No damage to citrus bloom was reported. Rainfall of around 1 inch was recorded over the Indian River area and 2 to 4 inches over the rest of the central part of the state.

SOUTH FLORIDA

The 1978-79 season was the mildest since 1974-75. November and December were warmer than normal while the remainder of the season was below normal. The coldest morning for the early part of the season was November 5. There were no cases of extreme cold in January and February. Rainfall was above normal at the beginning of the season and little, if any rain after the first of the new year.

NOVEMBER: The month was mild, averaging 3 to 4 degrees above normal. Most daytime temperatures reached the 80's with lows at nights in the 60's. There was only one cold night, the 5th, when readings dropped into the 40's and low 50's. Rainfall averaged 2 to 3 inches. However, the western portions were drier and Immokalee received only .15 inch. In contrast, West Palm Beach airport had nearly 11 inches.

DECEMBER: Daytime temperatures continued to climb into the 80's. Most fronts weakened considerably by the time they reached south Florida. The 18th to the 20th were the coldest periods when lows reached the mid 40's in the Everglades and low 50's along the Lower East Coast. Rainfall ranged from 3 to 4 inches except near 2 inches in the Homestead area. Heaviest rain came near the end of the month.

JANUARY: The weather pattern changed abruptly and the month averaged 1 to 2 degrees below normal. A strong front on the 2nd dropped temperatures into the 30's on the 3rd. A series of fronts passed through south Florida during the month, but the center of the coldest air stayed well north. Lows on the colder mornings were generally in the 40's with only a few spots in the Everglades dipping into the upper 30's. Rainfall averaged 4 to 6 inches in the Glades but only 1 to 2 inches along the southeast coast.

FEBRUARY: The coldest weather of the season in south Florida came on the first three days. Temperatures dropped into the 30's with a few below freezing temperatures on the 2nd in the Everglades. Temperatures continued on the cold side with most lows in the 40's in the period of the 9th to the 15th and again at the end of the month. Rainfall was light with most areas receiving less than 2 inches. This was about 1-1/2 inches below normal.

MARCH: The month continued a degree or two below normal despite the fact most daytime temperatures were in the upper 70's or 80's. Readings dropped into the 40's with a few upper 30's in the Glades on the 12th. A late seasonal cold spell also occurred on the 26th and 27th when temperatures again dropped into the 40's with some 30's again in the colder locations of the Everglades. However, the cold spell was short lived as temperatures by month's end were near 80 degrees. Rainfall came mostly the first week of the month. For the month, measurements in the Everglades totaled 1 to 2 inches and less than 1/2 inch along the Lower East Coast.

1978-79 PRODUCTION SUMMARY

Florida's 1978-79 season began with bloom starting to show about the first of March in some areas. A mid-February cold snap held trees dormant until that time, and moisture was plentiful in most producing areas. By the last of March, all areas and types of citrus were in full bloom.

Temperatures remained generally above normal levels throughout the season except for several cold snaps in January and February, which resulted in only very light leaf burn in isolated areas.

The initial forecast for the 1978-79 season was for 167 million boxes of round oranges. This was almost the same as the previous season's production, a surprise to most industry people. Evidently trees had not fully recovered from the January 1977 freeze. Final production was 164 million boxes, slightly less than the previous season and 12 percent less than the record high 1976-77 season's 186.8 million boxes. Set of fruit was very uniform and harvest patterns were considered to be normal for the season.

Grapefruit were forecast at 51 million boxes, slightly less than production for each of the previous two seasons. Final production totaled 50 million boxes. Fresh grapefruit shippers utilized almost 40 percent of the crop, nearly as great as the previous high in the 1975-76 season.

FCOJ yield was forecast in October at 1.29 gallons per box and ended the season at 1.34 gallons per box. This produced 173,053,000 gallons of FCOJ from 129,123,000 boxes. This was seven percent less than was packed the previous season.

California's season was marked by a severe freeze the second week in December. Temperatures were below 26 degrees for several nights with durations of up to 12 hours in some areas. Fresh shipments of oranges came to a standstill while damage assessments were made. Fresh shipments of oranges at 24,600,000 boxes were the lowest in several years. Grapefruit fresh shipments declined to the lowest level since the 1973-74 season. Lemons were also hard hit by the freeze and production was reduced from 20.3 million boxes in 1977-78 to 13.9 million in 1978-79.

Arizona's production was also affected by the freezing temperatures in December. Temperatures dropped to as low as 17 degrees, but most citrus producing areas ranged from 19 to 25 degrees with durations of six to eight hours. Both orange and grapefruit production were down because of the cold.

Texas harvested a near normal orange crop. Freezing weather the 10th of December caused damage varying from light leaf drop to tree mortality. Fresh grapefruit shipments were down almost 40 percent. Some oranges were diverted to processing but total production remained normal.

Tree Census

The Florida Crop and Livestock Reporting Service first began indexing the state's commercial citrus groves on aerial photography as of January, 1966. Ground crews in 4-wheel drive vehicles identified all the state's groves by year in which set, fruit type, and row spacing. Photo interpreters in the Orlando office then delineated the groves by variety blocks on positive photo transparencies at a scale of 1 inch to 660 feet. Variety blocks were measured with planimeters to obtain acreage and then indexed by land section.

The 1966 survey indicated there were 66,441,000 commercial citrus trees on 858,082 net acres of land. In addition, the survey provided acreage and number of trees by county, variety and year set. But, of equal importance, the inventory was designed for quick and economical updating. Since that time, the production area has been resurveyed each second winter - 1968 through 1978 - to determine changes.

Photographing begins in November when weather conditions are most favorable and is generally completed in 80 to 90 days. The same three mile wide flight lines established in 1966 are photographed on each succeeding flight. Approximately 14,000 square miles of photography is obtained at a 1 to 30,000 scale.

The latest survey shows there were 831,235 acres of commercial citrus as of January 1978. This is a net decline of 2.5 percent from the 852,369 acres in December 1976. The removal of 49,371 acres from commercial production during 1976 and 1977 more than offset the 28,237 acres of trees planted. Acreage gains were recorded in only a few counties, the principal ones being Hendry, Collier and Palm Beach. All types of citrus showed net declines except pink seedless grapefruit.

In addition to enumerating total changes in grove acreage, the surveys in 1976 and 1978 were designed to give more detail on acreage removals and additions. The results of this survey showed that one half of the acreage set in the calendar years 1976 and 1977 was reset plantings. Also, 24 percent of the new acreage was planted on land that had never before been used for citrus. Of the acreage that was removed from commercial production, approximately 15 percent was taken out for commercial development. The comparable figures for the years 1974 and 1975 showed a reasonably similar relationship.

The current survey also showed that most of the new acreage was located in the East Coast and Lower Interior areas of the state. However, no area of the state showed a net gain during this latest biennial survey.

There are approximately 1,200 photography enlargements on file. These are replaced over a four-year period, approximately 600 after each flight year. Information from the old enlargements is transferred manually to the new enlargements. Work on the eighth biennial survey began in November, 1979. Results will be available by late summer, 1980.

Florida, all citrus: Acres in commercial groves as of January, 1966 - 1978, with percent changes

Year	Acres	Change from	
		previous survey	1966 survey
Percent			
1966	858,082	--	--
1968	931,249	+8.5	+8.5
1970	941,471	+1.1	+9.7
1972	878,019	-6.7	+2.3
1974	864,098	-1.6	+ .7
1976	852,369	-1.4	- .7
1978	831,235	-2.5	- 3.1

1978-79 VALUE OF SALES, PRICES AND EXPORTS

VALUE

The preliminary on-tree value of all Florida citrus is a record \$1,009,920,000. This is 19 percent greater than last season's revised value of \$848,680,000.

Preliminary value is based only on that part of the crop that was priced at harvest, about 30 percent. When all participation plans are finalized, a revised value will be calculated.

The delivered-in price for all priced fruit (approximately 42 million boxes) going into FCOJ was \$.98 per pound of solids, only slightly more than last season's \$.95 per pound.

Florida, all citrus: Value of sales, on-tree, crop years
1969-70 through 1978-79

Crop year	Value	Crop year	Value
1969-70	\$244,676,000	1974-75	\$ 397,066,000
1970-71	315,882,000	1975-76	440,326,000
1971-72	427,245,000	1976-77	529,765,000
1972-73	394,645,000	1977-78 1/	848,680,000
1973-74	359,388,000	1978-79 2/	1,009,920,000

1/ 1977-78 revised. 2/ 1978-79 preliminary.

COUNTY PRODUCTION

Estimates of production by fruit type and county published by the Crop Reporting Service are based on objective survey data. Fruit numbers per tree obtained from the limb count survey done July-September are adjusted for droppage to harvest time, combined with harvest size, and expanded by tree numbers.

These county estimates are calculated at the request of the citrus industry, from sample data obtained from the citrus crop estimates program. Since the sample is designed for estimates at the State-wide level, county samples are roughly proportionate to the amount of citrus—thus some samples are very small with the county estimates subject to large sampling variability.

PRICES

All on-tree prices reported by the U.S. Department of Agriculture's Economics, Statistics, and Cooperatives Service and the Florida Crop and Livestock Reporting Service represent the average price received by growers for their fruit by types. Prices are based on records of commercial fresh fruit and processed fruit returns. The term "on-tree" relates to fruit value before it is picked and hauled from the grove.

Each season, beginning with the first month that three percent of a fruit type is harvested, the Florida Crop and Livestock Reporting Service estimates an average monthly price. Fresh fruit sales organizations provide the average F.O.B. price and processors supply an average spot and cash price for fruit delivered to plants. From these values, an estimated charge for picking, hauling and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales for each month. At the end of the season,

monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price.

A year later, after most processed products are sold, a survey of cooperatives and firms with market participation plans is conducted to establish a value of fruit previously classed as non-priced fruit. These prices, combined with spot and cash prices collected earlier, are weighted together to determine the final process price received by growers for various varieties of citrus. Charges for picking, hauling and packing, as determined by University of Florida economists, are deducted from the weighted average of prices obtained from all segments of the citrus industry to arrive at the final on-tree price received by growers.

FOREIGN EXPORTS

Exports of fresh Florida citrus to countries other than Canada and Mexico for the 1978-79 crop year accounted for a record 11,712,000 cartons, up 64 percent from the 7,158,000 cartons in 1977-78 and 18 percent over the previous peak export movement of 9,938,000 cartons in 1975-76. Grapefruit contributed 90 percent of the overseas shipments with Japan the principal receiver followed by France and Holland. Although both Japan and Europe reflected increases of Florida grapefruit, the continent showed the greatest jump as decreased exports from Texas were filled by shippers from this state. Expansion of traditional accounts also helped Florida producers move more to Europe in 1978-79.

Orange exports of 1,030,000 cartons from the state were up substantially in 1978-79 over the 404,000 cartons shipped the previous crop year. Some 86 percent of the overseas movement in 1978-79 went to Japan, Puerto Rico and New Zealand. The annual volume of oranges varies greatly from year to year due to strong competition from other world producing countries.

A small quantity of specialty fruits go to Puerto Rico, The Netherlands, Japan, New Zealand and France.

Orange concentrate exports, as reported by the Florida Citrus Processors Association, increased slightly (4 percent) during the July 1978 through June 1979 period compared to the July through June 1977-78 period. Export statistics by country of destination have not been available since January 1, 1978 when the U.S. Bureau of the Census discontinued these data. During 1978-79, Florida processors exported 10 million gallons of 45 degree Brix concentrate compared to 9.6 million gallons the previous year. Strong domestic U.S. demand plus plentiful concentrate supplies from Brazil continued to limit the potential for export market expansion during 1978-79.

Citrus box weights: Approximate net weight in pounds

History of Florida's Citrus Industry

The citrus tree is a native of the Orient. From this area it was carried ever westward by man, to India, to the Mediterranean and on across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Haiti. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were grown in abundance around St. Augustine at that time. Early settlers in Florida some two centuries later found wild citrus trees scattered over the state. One of the oldest, cultivated groves planted in Florida (Hume, 1926 p. 95) is thought to be the Don Phillippe grove in Pinellas County, planted some time between 1809 and 1820.

Citrus production in Florida had reached an all time high of more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. Since that time the volume steadily increased. As the decade of the seventies began Florida's dominance of the Nation's citrus became even more apparent. In 1978-79, Florida had 75.9 percent of the Nation's production.

Footnote 1/ for pages 35 thru 37. Final Mexico import shipments to the U. S. are reported by FAS as a combined total for oranges and tangerines. The total shown on pages 35 thru 37 has been broken down proportionally into oranges and tangerines from Plant Quarantine data reported at the time of the crossing. Plant Quarantine releases gave separate totals for these two types of citrus. Mexican shipments excludes Canadian shipments.
