F O R E W O R D

The Florida Crop and Livestock Reporting Service functions as the field unit of the Division of Agricultural Statistics of the Bureau of Agricultural Economics, United States Department of Agriculture, with the Department of Economics, Agricultural Experiment Station, University of Florida, cooperating on vegetable estimates. In this capacity it prepares for its Washington office estimates, forecasts, current reports and records on Florida agriculture. These are correlated with similar data for all other States for the presentation of a systematic statistical story of the nation's crops. Through cooperative effort a much more thorough and complete statistical coverage is made of the many crops and such an arrangement eliminates duplication of effort between State and Federal Agencies.

During the year the Orlando office issues semi-monthly reports on vegetable crops in the State, giving current reports on the progress and prospects in the various producing areas. Acreage and production forecasts are prepared monthly during the producing season and are released around the 10th of each month. All of these reports are available to interested persons free of charge.

This booklet was prepared in response to a demand for county data relating to the acreage of vegetable crops within the State and for readily available statistical information concerning the production and value of these crops. This information is presented by seasonal groupings, such as fall, winter and spring, with a seasonal summary for each crop covered. Those crops which are of minor importance commercially are not included in this summary. Neither does it include vegetables grown in home gardens or in small market garden plots adjacent to some of our larger cities. The watermelon acreages do not include plantings made strictly for seed. Data on potatoes refer only to the commercial crop. In recent years squash, cauliflower and carrots have become commercially important in this State and it is hoped that satisfactory statistics can be developed on these crops in the near future. Additional copies of this booklet may be had upon request as long as the supply lasts. It is our intention in the future to keep this booklet revised and brought up to date after the close of each shipping season.

The data contained in this report except for shipment information are estimates and are based on reports by, and interviews with, growers, shippers, marketing associations, seedsmen, county agricultural agents, railroad representatives, canners and processors, the Federal-State Inspection and Market News Services, the Florida State Marketing Bureau, the Florida State Marketing Board and its market managers, the Production and Marketing Administration, (formerly A.A.A.) and other well-informed sources. We would like to take this occasion to gratefully acknowledge our indebtedness to each person and organization who has contributed to the development of these data. Their cooperation has made this report possible.

DEFINITIONS AND EXPLANATIONS

ACRES FOR HARVEST - Acres for harvest is considered as being all acreage from which a crop could have been harvested had economic conditions (prices, available labor, etc.) warranted the harvest. Acreage which produces such low yields or poor quality that the crop is not worth picking at any reasonable price is considered as crop failure and is not included in the acreage for harvest. Unharvested acreage which produces yields which would be harvested at reasonable prices is included in acreage for harvest.

ECONOMIC ABANDONMENT - This category includes mature production not harvested because of economic factors, such as low prices, shortage of labor, etc. Such loss of production includes quantities left in fields partially harvested as well as production on acreage abandoned for economic reasons.

YIELD - Yield refers to total production of merchantable quality produced on an acre basis and may include unharvested production.

PRODUCTION - Total production represents the yield times the acres for harvest. Production of value is that part of the production which was harvested and sold or utilized while in the fresh state and does not include economic abandonment.

UNIT VALUE OR PRICE - All of the prices used in this report are on an F.O.B. basis less selling charges. In the case of some commodities which are sold in different units than the one listed, these units are converted into the equivalent of the ones used.

TOTAL VALUE - The total value is the price per unit times the production of value.

CANNED OR PROCESSED ACREAGE AND PRODUCTION

The acreage of vegetables in Florida planted solely for canning and processing purposes during the period covered by this publication has been insignificant. The acreages of beans and tomatoes, the principal crops canned, are planted primarily for fresh market but during recent years substantial quantities have been canned. In order to conform to the national pattern for recording the fresh and processed production, we have shown the equivalent acreage on which this processed production would have been grown and listed the remainder as acreage grown for fresh market production.
