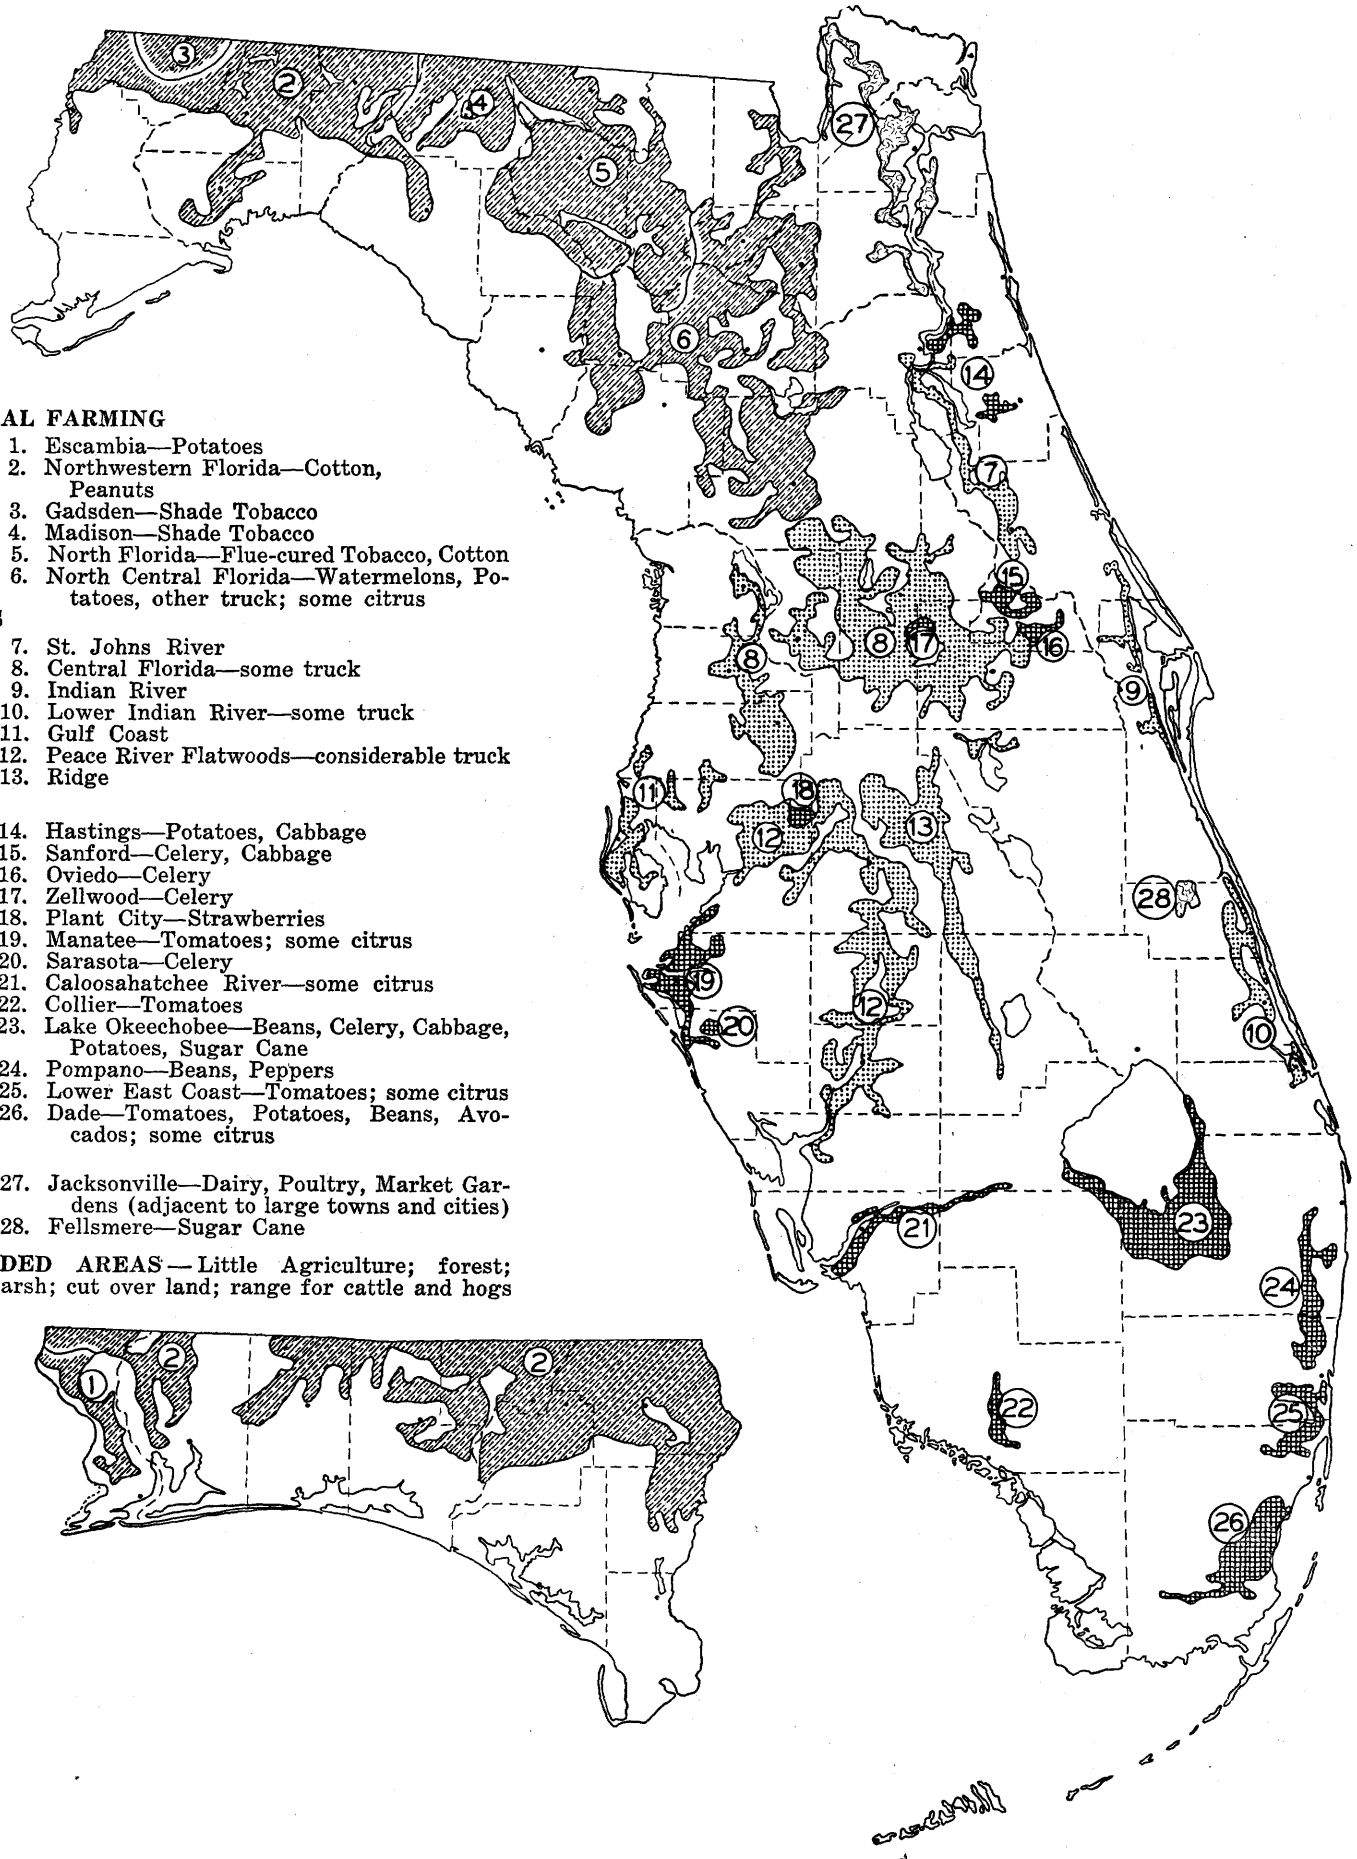
FLORIDA TYPE OF FARMING AREAS

Prepared by the Florida Agricultural Experiment Station, Department of Agricultural Economics. September 1, 1945.

Sources of Information: 1. Land in farms—Aerophotographs.
2. Type of farming areas—United States Census data and technical agricultural workers.



GENERAL FARMING

1. Escambia—Potatoes
2. Northwestern Florida—Cotton, Peanuts
3. Gadsden—Shade Tobacco
4. Madison—Shade Tobacco
5. North Florida—Flue-cured Tobacco, Cotton
6. North Central Florida—Watermelons, Potatoes, other truck; some citrus

CITRUS

7. St. Johns River
8. Central Florida—some truck
9. Indian River
10. Lower Indian River—some truck
11. Gulf Coast
12. Peace River Flatwoods—considerable truck
13. Ridge

TRUCK

14. Hastings—Potatoes, Cabbage
15. Sanford—Celery, Cabbage
16. Oviedo—Celery
17. Zellwood—Celery
18. Plant City—Strawberries
19. Manatee—Tomatoes; some citrus
20. Sarasota—Celery
21. Caloosahatchee River—some citrus
22. Collier—Tomatoes
23. Lake Okeechobee—Beans, Celery, Cabbage, Potatoes, Sugar Cane
24. Pompano—Beans, Peppers
25. Lower East Coast—Tomatoes; some citrus
26. Dade—Tomatoes, Potatoes, Beans, Avocados; some citrus

OTHER

27. Jacksonville—Dairy, Poultry, Market Gardens (adjacent to large towns and cities)
28. Fellsmere—Sugar Cane

UNSHADED AREAS—Little Agriculture; forest; marsh; cut over land; range for cattle and hogs

COUNTY TOTAL ALL VEGETABLE ACREAGES BY SEASONS Pages 89, 90 & 91

I. INTRODUCTION

While the information in this booklet is entirely composed of statistics on vegetables, we are going to change our usual introduction and attempt to outline and develop some facts about the Crop Reporting Service of the Bureau of Agricultural Economics and cooperating agencies which you may not have thought of or have taken for granted throughout the years of its operation.

The collection and publication of crop and livestock statistics is the oldest activity in the Department of Agriculture, having been started in 1862. These reports were started at the request of farmers to protect them, as they said, from the effect of false and misleading reports emanating from those who wished to distort actual situations and thereby make illegitimate profits at the expense of the producers. If this condition was true then, it could be true today to an even greater degree if this unbiased service did not exist. Any agency making forecasts of conditions and estimates of agricultural production can be wrong occasionally due the varying conditions affecting agriculture, but through the years the Crop Reporting Service has a record of reasonably accurate and conservative predictions. Some people have a tendency to criticize these reports as "Government" reports. They are Government reports in as much as they are compiled and issued by the Government, but in the last analysis they are the summation of individual reports from thousands of producers and other well informed sources. Often there are wide differences of individual opinions on situations, all of which are carefully analyzed and weighed before any report is released. A better definition of Government reports would be producers' reports compiled, analyzed and issued by the Government for the benefit of those interested in agriculture and its related industries.

II. THE NEED FOR TIMELY ECONOMIC AND STATISTICAL FACTS ABOUT AGRICULTURE

These remarks must necessarily be brief and at the same time general as they could be expanded into volumes. The need for measuring farm production and income is obvious if for no other reason than it is good economic housekeeping for the Nation, but this is by no means the chief reason. Agriculture is a far-flung and loosely knit industry of rugged individualists. So widespread and heterogeneous that very little can be accomplished in its overall bookkeeping within the industry itself. As scientific advancement proceeds, production capacity becomes greater and marketing problems increase. In order that the agriculture of the nation may operate efficiently and successfully, it is necessary that the farmers, the people who do business with farmers, and the Government be constantly informed with up-to-date facts about present and prospective supplies of farm products and about the income and purchasing power of farmers as well as many other fundamental factors affecting farm prosperity.

To meet some of these needs, the Bureau of Agricultural Economics, of which the Crop Reporting Service is a part, has developed and publishes basic statistical reports throughout the year giving current estimates of production, stocks on hand, and prices of over 150 farm products, and about such items as wages and employment, the financial condition of agriculture and farm population. There is no better single solution to the Nation's agricultural problems than well informed farmers and distributors of their produce who, having complete knowledge of the existing facts, can make their future plans wisely.

III. WHO USES CROP REPORTS AND AGRICULTURAL STATISTICS

The list which follows is far from complete, but it does indicate what kind of people ask for farm statistics regularly, and how they use the figures in servicing agriculture.

1. Individual farmers: Unbiased and up-to-date reports furnish intelligent and wise farmers with facts which enable them to help themselves. They can analyze their competition and prospective demand, and adjust their planting, breeding, livestock feeding, and marketing programs accordingly. True and accurate facts properly presented will usually bring satisfactory voluntary action.

2. Farmers' organizations, National organizations such as the Farm Bureau, Farmers' Union, and the Grange, and local organizations such as the Florida Vegetable Committee and the Florida Citrus Commission use them in keeping abreast of current agricultural problems and in determining their policies in their particular fields.

3. Farmers' cooperatives: Use them in planning their purchasing, sales, and marketing programs.

4. Railroads and other transport services use them in determining the number of cars and trucks needed to move the agricultural products of particular areas. The statistical data on production and time of harvest enable these carriers to distribute their equipment where it is most needed. This is especailly important in wheat areas and with perishable products such as fruits and vegetables.

5. Industrial organizations, manufacturers, jobbers, merchants, seedsmen, and mail-order houses use them in planning their production, inventories, sales, and advertising programs. In Florida this applies mostly to farm machinery, such as trucks, tractors, packinghouse machinery, seed, fertilizers, insecticides, fungicides, containers, ice, feeds and miscellaneous farm articles. Farmers are fully aware of what it means to be short of the necessary materials when trying to produce a crop.

6. Processors of agricultural products, such as packers, canners, millers, slaughters, and manufacturing plants use them in planning where to establish their plants, determining the source and volume of their raw products, the size of their operations, and in marketing their products.

7. Dealers and handlers of agricultural products use them in their market operations. (Accurate data on the present and prospective supply of agricultural products help eliminate some of the middleman's risks and thereby tend to reduce the margin he requires, and to stabilize prices.)

8. Operators of warehouses and other storage facilities use them in planning storage for each year's crops and livestock products.

9. Banks, insurance and credit organizations use them in calculating the risks in financing farm production, storage, and marketing; in managing farm properties under their control; or in insuring farmers against crop failures, livestock losses, etc.

10. Editors and writers for farm and trade papers, newspapers, and radio services use them in developing background for articles and programs of timely interest and value to farmers.

11. State agricultural colleges, extension services and State departments of agriculture use them in advising farmers about planting, breeding, and marketing operations. Statistical data are the basis for their educational programs, and also the measure of the effectiveness of their crop and livestock work. They are also the basis of analysis of individual farm problems.

12. Agricultural research workers in industry, State experiment stations, private research organizations and Government use them as basic agricultural data necessary for many types of economic research on such subjects as production, marketing, and other phases of the business side of farming.

13. Economists use them in preparing Outlook and Situation Reports. Various periodic reports are published by the Bureau of Agricultural Economics and by Land-Grant Colleges which present an analysis of current facts about farm products, food supplies and agricultural markets. Such reports give farmers a picture of the current economic situations and prospects which may affect their business operations or future plans. The Bureau's basic statistics, used in making these analyses, are supplemented with information collected by research workers directly and by data from the Production and Marketing Administration and from fact-finding agencies outside the Department of Agriculture, such as the Federal Reserve Board, the Department of Commerce and the Department of Labor.

14. Legislators and administrators in local, State, and National governments use them as a basis for constructive public programs for farmers; as a source of current facts on farm production and of long-time records; for determining quickly the extent of damage done by drought, floods, and hurricanes; for dealing with such international groups as the International Emergency Food Council and the Food and Agriculture Organization of the United Nations; for establishing foreign trade policies; for carrying on the "action programs" of the Department of Agriculture--conservation, crop insurance, crop loans, commodity buying programs, and distribution of surpluses. (The Government programs affecting farmers are largely based on the statistics compiled by the Bureau of Agricultural Economics--acreage, yield, production and stocks of crops, livestock inventory numbers, production of meat animals, dairy products, eggs, poultry, wool, etc.; agricultural prices, parity indexes, farm cash receipts, and expenses.)

Lack of, or incomplete, statistical data might easily cost the taxpayers many times the expense of maintaining an efficient agricultural estimating and statistical service.

ORGANIZATION AND COOPERATION

The Bureau maintains 41 State statistical offices which serve all the states. The State agricultural statisticians in these offices are responsible for maintaining cooperative relations with State agencies and contact with farmers and other people; for collecting statistical data relating to agriculture for their respective States and for analyzing, summarizing and interpreting the information which they forward to the Crop Reporting Board or to statistical divisions in Washington for review and assembly into State and National averages and totals.

In 40 States formal cooperative agreements are maintained with State departments of agriculture, or State colleges of agriculture, or both, for the collection and publication of agricultural statistics. These cooperative relationships eliminate duplication in the collection and publication of agricultural statistics; and where enough State funds are allotted, make it possible to provide better local reports such as county estimates; and permit the most effective use of the State agricultural censuses, which are taken annually in 13 States.

On the page immediately following is a chart showing in outline the Bureau's nation-wide fact-finding organization. This chart shows the sources from which agricultural statistics are obtained, the collecting, processing and disseminating units, and finally a partial list of the users of this information.

It is our sincere hope that this brief discussion of the Bureau's activities will lead to a better understanding of the work being done and encourage even greater use of the information now available by those interested in production and marketing as well as those interested in servicing our agriculture; to the end that the industry will always be able to adapt itself to the progress and changes in our Nation's economics.

DEFINITIONS AND EXPLANATIONS

SEASONAL GROUPINGS

In order that competitive production within the State of Florida and the United States may be classified on a National basis under reasonably uniform groups, we have established a National pattern which is based on most active harvesting periods. These major groups are WINTER, SPRING, SUMMER, and FALL. The WINTER group includes the months of January, February, and March; SPRING includes April, May, and June; SUMMER includes July, August, and September; and FALL includes October, November, and December. These periods are not rigidly fixed and the harvesting period for a particular grouping may extend over into the preceding or following group. However, in arranging our data we have followed these groupings in so far as it is practical. It can be readily seen that some systematic order of grouping is necessary for comparative purposes and, while they may not always agree with some local designations now in use, it is best for all concerned to handle our classifications on a National basis.

PLANTED ACREAGE

Estimates of planted acres for any seasonal group consist of acres for harvest (see below) during that particular seasonal group plus any acreage planted for harvest during the season, but which was lost or destroyed and did not produce a crop in the season under consideration. This definition is based on a "loss of crop" concept. If the acreage is lost and not replanted it is counted as planted. If it is lost but replanted for harvest in the same season as the original acreage would have been harvested, the acreage replanted is not considered as additional acreage planted. But, if the acreage lost is replanted for harvest in a later season, it is considered as planted for both seasons and as acres for harvest only for the later season.

ACRES FOR HARVEST

Acres for harvest is considered as being all acreage from which a crop could have been harvested had economic conditions (prices, available labor, etc.) warranted the harvest. This includes mature acreage on which the harvest was postponed or delayed too long due to economic reasons and the production lost thereby. Acreage which produces such low yields or poor quality that the crop is not worth picking at any reasonable price is considered as crop failure and is not included in the acreage for harvest. Unharvested acreage which produces yields which would be harvested at reasonable prices is included in acreage for harvest.

ECONOMIC ABANDONMENT

This category includes mature production not harvested because of economic factors, such as low prices, shortage of labor, etc. Such loss of production includes quantities left in fields partially harvested as well as production on acreage abandoned for economic reasons. Acreage abandoned at any stage of growth before maturity will be considered as loss of acreage or crop failure rather than economic abandonment of production.

YIELD

Yield refers to total production of merchantable quality produced on an acre basis and may include some unharvested production left in fields for economic reasons.

PRODUCTION

Total production represents the yield times (X) the acres for harvest. Production of value is that part of the production which was harvested and sold or utilized while in the fresh state and does not include economic abandonment.

UNIT VALUE OR PRICE

All of the prices used in this report are on an F.O.B. basis or its equivalent, less selling charges. In the case of some commodities which are sold in units other than the one listed, these units are converted into the equivalent of the ones used.

TOTAL VALUE

The total value is the price per unit times (X) the production of value.

CANNED OR PROCESSED ACREAGE AND PRODUCTION

The acreage of vegetables in Florida planted solely for canning and processing purposes during the period covered by this publication has been insignificant. The acreages of beans and tomatoes, the principal crops canned, are planted primarily for fresh market but during recent years substantial quantities have been canned. In order to conform to the National pattern for recording the fresh and processed production, we have shown the equivalent acreage on which this processed production would have been grown and listed the remainder as acreage grown for fresh market production.

GENERAL COMMENTS

This booklet was prepared in response to a demand for county data relating to the acreage of vegetable crops within the State and for readily available statistical information concerning the production and value of these crops. Those crops which are of minor importance commercially are not included in this summary. Neither does it include vegetables grown in home gardens or in small market garden plots adjacent to some of our larger cities. The watermelon acreages do not includ plantings made strictly for seed. Data on potatoes refer only to the commercial crop. There are still a few crops which are commercially important in this State such as squash, sweet corn, okra, and cowpeas for fresh market on which we do not have adequate data for making current estimates. It is hoped that satisfactory statistics can be developed on these crops in the near future.

ACKNOWLEDGEMENTS

The data contained in this report except for shipment information are estimate and are based on reports by, and interviews with, growers, shippers, marketing associations, seedsmen, county agricultural agents, railroad representatives, canners and processors, the Federal-State Inspection and Market News Services, the Florida State Marketing Bureau, the Florida State Marketing Board and its managers, the Production and Marketing Administration, and other well informed sources. We would like to take this occasion to gratefully acknowledge our indebtedness to each perso and organization who has contributed to the development of these data. Their cooperation makes these reports possible.

*Note: These totals include only the commercial vegetable crops listed in this booklet. Many counties have sizeable acreages of minor vegetable crops for which no estimates are made by this service. In 1939-40, 300 acres of canning beans are omitted from county distribution, but canning beans are included in all other years.
