Official Record

The first official fruit estimates were made for apple production in 1889. As the need for additional information was made, additional estimates were added to the program. The information presented in this appendix represents the record of official data to assist in analyzing the Fruit Acreage Survey. Each fruit has footnotes to document changes in policy and definitions. Fragmented data from early years has been converted to current units for ease of comparison.

Estimates published are public information. Some estimates that would divulge an individual operation (less than three individuals or one operation controlling 60 percent of the total) have (D) to indicate the estimate cannot be published. These unpublishable estimates are combined with other categories to provide a balance of the parts equalling the total.

Forecasts are made during the growing season for each fruit. These forecasts are published monthly throughout the growing season. End of year estimates are made after the growing season and include a preliminary disposition. These estimates are open for revisions one year later when data from processors, shippers, and marketing associations are final. Blocks of years are open for revisions after Census of Agriculture benchmark data is available. The most recent Census of Agriculture was 1982 that closed 1978-1982 estimates for revisions. The next Census of Agriculture will relate to 1987, and 1983-1987 can be revised if necessary.

TOTAL PRODUCTION - is the quantity actually harvested plus quantities which would have been acceptable for fresh market or processing but were not harvested because of economic or natural reasons.

UTILIZED PRODUCTION - is the amount sold plus the quantities used at home or held in storage.

UTILIZATION - refers to first utilization, not necessarily final utilization. For example, frozen fruit includes some fruit that may be later used for making preserves. Grade-outs for fresh market fruit which are processed are included in the processing quantity. Fruit graded-out from canning or freezing and utilized for juice is included with juice.

PRICES - are a season average for all methods of sale. For a crop sold for both fresh market and processing, the season average price is a weighted average of the fresh and processing price.

Prices for fresh fruit sales in Washington are equilavent returns at packinghouse door. The equilavent packinghouse returns represent adjusted prices. F.o.b. packed prices are adjusted to an equilavent incoming packinghouse door price by subtracting all costs that accumulate between the incoming packinghouse door and the f.o.b. price. These costs include grading, packing, inspecting fees, selling, and other costs.

APPLES, COMMERCIAL CROP - orchards of 100 or more bearing trees.

1/ Utilized production - The sum of fresh market and processed do not equal utilized production for 1934 - 1958 because home use is not included in the breakdown.

2/ Prices - Season average price estimates were started in 1909 and represented an "as sold" price. The basis for prices changed in 1949 to an equivalent PHD price (packinghouse-door or processing plant door.)

3/ Fresh market price estimates started in 1934. Processed price for 1934 - 1943 was a combined Washington-Oregon price. Processed price estimates started in 1944 for Washington.

4/ Canned price - Data for 1944 - 1958 represents the price for both canned and frozen. Data for 1959 - 1985 is for apples used only as canned.

5/ Juice/Frozen quantity - Data for 1944 - 1958 represents the quantity of apples used as frozen. Data for 1969 - 1985 represents the quantity of apples used for juice.

(D) Estimate not published to avoid disclosure of individual operations.

1/ Utilized production - The sum of fresh market and processed do not equal utilized production for 1934 - 1958 because home use is not included in the breakdown.

2/ Prices - Season average prices started in 1938 and represent an equivalent PHD price (packinghouse-door or processing plant door.)

3/ Other Processed - Data for 1943 - 1964 represent the quantity of sweet cherries processed as frozen. Data for 1969 - 1985 represent the quantity processed for frozen and juice.

* Small quantities of other utilization included with brined for 1934-1942, 1955-1956, and 1965-1968 to avoid disclosure of individual operations.

(D) Estimate not published to avoid disclosure of individual operations.

1/ Utilized production - the sum of fresh market and processed do not equal utilized production for 1934 - 1958 because home use is not included in the breakdown.

2/ Prices - Season average price estimates were started in 1924 and represent an "as sold" price. The basis for prices changed in 1959 to an equivalent PHD price (packinghouse-door or processing plant door.)

3/ Fresh market and processed estimates were started in 1934 for quantity, and in 1965 for price.

4/ Includes minor quantities of American hybrids used primarily for juice.

* Quantities for grapes used for wine during 1959 - 1970 included in juice.

(D) Estimates not published to avoid disclosure of individual operations.

1/ Utilized production - The sum of fresh market and processed do not equal the utilized production for 1934 - 1958 because home use is not included in the breakdown.

2/ Prices - Season average price estimates were started in 1909 and represent an "as sold" price. The basis for price changed in 1959 to an equivalent PHD price (packinghouse-door or processing plant door.)

3/ Prices - Separate price estimates started in 1938 for fresh market and processed. Peach processed utilization not published after 1958 to avoid disclosure of individual operations.

(D) Estimates not published to avoid disclosure of individual operations.

1/ Utilized production - The sum of fresh market and processed do not equal utilized production for 1930 - 1958 because home use is not included in the breakdown.

2/ Prices - Season average price estimates were started in 1919 and represent an "as sold" price. The basis for prices changed in 1949 to an equivalent PHD price (packinghouse-door or processing plant door.)

3/ Fresh market price started in 1949.

4/ Processed - Quantity estimates started in 1930. Quantity processed for 1959 - 1969 combined with fresh market to avoid disclosure of individual operations.

(D) Estimates not published to avoid disclosure of individual operations.

1/ Utilized Production - The sum of fresh market and processed do not equal utilized production for 1929 - 1958 because home use is not included in the breakdown.

2/ Prices - Season average price estimates started in 1919 and represent an "as sold" price. The basis for prices changed in 1959 to an equivalent PHD price (packinghouse-door or processing plant door.)

3/ Fresh market and processed quantity and price estimates started in 1929. Processed utilization discontinued in 1959 to avoid disclosure of individual operations.

4/ Canned - Quantity for 1952 - 1958 includes minor quantities of other utilization. Prices for 1952 - 1958 represent canned price.
