

## APPLES

New England apple production ranked seventh in the United States for utilized production in 2001, producing 1.7 percent of the Nation's total output. The region placed sixth in total value of utilized production in 2001, exceeded only by Washington, New York, California, Michigan, and Pennsylvania.

On May 7, 2001, a severe frost hit the southern New England States when fruit trees were at peak bloom. Damage was extensive at many locations. Warm and dry weather throughout the end of May provided favorable conditions for pollination. By mid-

June, due to earlier frost, the apple crop was reported to be in very poor condition in the southern New England States, and in good condition in the northern most States. By mid-July, both apple scab and hail damage were reported throughout the area.

Early apples were ready for harvest at the beginning of August, and the New England crop condition was rated good overall. The 2001 apple crop available for utilization totaled 3.9 million bushels, five percent below the previous year's utilized output. Despite the apple production decrease from 2000, the New England 2001 apple crop utilized value was placed at \$45.9 million, three percent above the previous year due to higher prices.

Apples used for fresh market comprised 77 percent of the 2001 apple crop, up from the 74 percent in 2000. Both 2001 fresh and processing apple prices increased from 2000. Fresh apples sold for five percent above the previous year, while the processing fruit price increased by 16 percent.

*[Apple chart appears on page 61.]*

<sup>1/</sup> Statistics are for commercial orchards with 100 or more trees.<sup>2/</sup> Yield is based on total production.<sup>3/</sup> Total production is quantity actually harvested plus quantities which would have been acceptable for fresh market or processing but were not harvested because of economic or natural reasons.<sup>4/</sup> Utilized production is the amount sold plus the quantities used at home or held in storage.
