

FIELD CORN

The 2001 New England corn silage crop weighed in at 3.4 million tons, seven percent more than the 2000 production. Corn acreage harvested for silage in New England totaled 175,000 acres in 2001; three percent less than the previous year. In 2001, the corn silage yield in New England averaged 19.4 tons per acre compared with 17.7 tons per acre in 2000. The 2001 crop was valued at \$93.4 million, three percent more than 2000's value.

Warm and dry spring weather provided excellent planting conditions and allowed growers to plant 80 percent of the corn crop by June 1, compared with the normal of 50 percent planted. Hot, humid weather with intermittent thunder showers continued into July with growers keeping an eye out for armyworm damage. Cooler temperatures and scattered showers during September did little to relieve drought conditions. Both silage yield and quality varied widely depending on moisture during the growing season and reported armyworm damage.
