

DRY HAY

Drought and armyworms in July combined to significantly reduce dry hay yields in New England in 2001.

Dry hay yields for alfalfa and all other hay averaged 1.71 tons per acre in 2001, down nine percent from the previous year and the second lowest yield on record in the region since 1972. Dry conditions allowed more acreage to be baled as dry hay than in the previous year's wet season. Farmers cut 596,000 acres in 2001, an increase of 6,000 acres

from 2000. The acreage increase was not enough to offset the low yields, however, the total dry tonnage weighed in at 1.0 million tons, which was eight percent less than a year ago and the smallest dry hay crop on record in the six-State region. The combined alfalfa and other dry hay price averaged \$121 per ton in 2001, unchanged from the previous year. Although dry hay production decreased from the previous year, there was no change in the price.

^{1/} All Hay Price per Ton equals the Value of Production÷Production, rounded to the nearest dollar.

^{2/} All Hay Value of Production equals (Alfalfa Production x Alfalfa Price) + (Other Hay Production x Other Hay Price).
