

Field Crop Program March 2019

Every 5 years NASS conducts a program review following the completion of the Census of Agriculture. The primary purpose is to ensure that the NASS annual estimating program targets commodities and states most relevant based on the latest available information. Last fall we announced the program review and requested stakeholder input.

The primary source of information for the program review is the Census of Agriculture, since it is the most comprehensive source of data; however we also take into consideration estimates from the current annual estimating program and administrative data.

The program changes balance resources across all of the programs included in the annual estimating program, which represents over 400 individual reports.

Chickpeas removed from the dry edible bean estimates/totals.

Removing the chickpeas from the dry bean estimates has been an industry request for many years. This move will make NASS estimates more consistent with industry and other USDA agencies.

Seasonal estimates eliminated for potatoes.

NASS is eliminating the seasonal breakout of potato estimates. Only all potato estimates will be published.

Publish sweet potato estimates in *Vegetables* report.

NASS will publish sweet potato estimates in the annual *Vegetables* report instead of the *Crop Production* report.

Objective Yield

NASS is making some modifications to the Objective Yield program. This includes:

- Eliminating Potato Objective Yield
- Removing Louisiana and North Carolina from Cotton Objective Yield
- Eliminating the August survey period for Cotton (except Texas), Corn, and Soybeans
- Reducing sample sizes for all crops

The following tables document the survey periods and sample sizes by crop.

In-season forecasts for field crops.

NASS publishes in-season forecasts for a number of field crops. The following table indicates the crops that are forecasted by month.

Note: "Federal" indicates forecast is part of the NASS annual estimating program.

^{1/} Only Arizona and California forecasted.

States included in the estimating program for field crops.

For each crop, both production and total value of production were reviewed. Totals were arrayed from largest to smallest. States that account for the largest proportion of the total were identified for inclusion in the annual estimating program. This allows us to provide the most useful data to the agricultural sector in the most efficient means possible given the limited available resources.
